## FOREWORD

The *NSW Performance Monitoring System* (page 3) has been conceived and implemented as a ‘one stop shop’ for continuous productivity and performance improvement by the NSW local water utilities (LWUs). The System assures data reliability, minimises red tape and avoids duplication in reporting. It enables DPI Water to develop evidence based policies and guidelines for the local water utilities to improve productivity and to annually provide the required LWU data to the Australian Bureau of Meteorology (for publication in the annual *National Performance Report for Urban Water Utilities* ([www.bom.gov.au](http://www.bom.gov.au))) and the Australian Bureau of Statistics, as well as for statewide reporting such as the *NSW Performance Monitoring Report*, this *Benchmarking Report* and the reporting for *NSW 2021* and the *State of the Environment Report*.

In line with the National Water Initiative, which extends the 1994 *Strategic Framework for Water Reform* and *National Competition Policy*, the NSW government has developed the *Best-Practice Management of Water Supply and Sewerage Guidelines*<sup>1</sup>. These guidelines, which were updated in 2007, are the key driver for reform of planning, pricing and management and for continuing productivity and performance improvement by each utility through the *NSW Best-Practice Management (BPM) of Water Supply and Sewerage Framework* (page 6). The *BPM Framework* requires LWUs to undertake annual performance monitoring in accordance with the *National Water Initiative*<sup>2</sup>, with the aim of improving productivity and the quality and efficiency of services to all NSW residents. Performance monitoring is also important for public accountability and has been strongly endorsed by both the Independent Pricing and Regulatory Tribunal<sup>3</sup> and the Productivity Commission<sup>4</sup>.

This *2014-15 NSW Water Supply and Sewerage Benchmarking Report* discloses the full suite of NSW water supply and sewerage performance indicators for all NSW water utilities including Sydney and Hunter Water Corporations over the past six years, enabling each utility to monitor trends in its performance indicators and to improve its productivity and performance through benchmarking against similar utilities. Independent auditing and data validation assure data reliability of the NSW Performance Monitoring System (pages 1 and 351).

A summary of the key performance indicators for all NSW urban water utilities, together with the overall statewide performance of the NSW regional water utilities and comparison of that performance with interstate utilities, are provided in the companion report *2014-15 NSW Water Supply and Sewerage Performance Monitoring Report*.

The Benchmarking Report has been prepared by DPI Water since 1986. To facilitate comparisons, the Minister for Lands and Water has made both the performance monitoring report and the benchmarking report available on the DPI Water website ([www.water.nsw.gov.au](http://www.water.nsw.gov.au)).

To provide a balanced view of the long-term sustainability of NSW water utilities, a triple bottom line (TBL) accounting focus has been adopted, with performance reported on the basis of social, environmental and economic performance indicators.

NSW performance monitoring and benchmarking also provide valuable data for continuous performance improvement by disclosing the present position and facilitating development of suitable information and evidence based responses to address the future water supply and sewerage needs for regional NSW. This ensures an appropriate focus and targeting of responses and initiatives to address current and emerging issues. Page 1 provides a summary of such information and responses.

## ACKNOWLEDGEMENTS

Local Government NSW (LGNSW) is acknowledged for its strong and continuing support for the NSW annual water supply and sewerage performance monitoring system since its commencement in 1986.

The public health regulator, NSW Health is acknowledged for its oversight of drinking water quality in regional NSW, including administering the preparation and implementation of a Drinking Water Management System (*Public Health Act 2010*) by each utility providing a drinking water supply and for its contributions to Appendix E and Appendix B (sampling location and frequency). NSW Health has also provided additional water quality data (from the NSW Health Drinking Water Database) and water quality monitoring compliance data, which has been incorporated into Tables 5 and 12 and Appendices D1 and D3.

The NSW Local Government Water Directorate is also acknowledged for its strong support, contributions and feedback to facilitate ongoing review and refinement of the NSW Performance Monitoring System.

The continuing success of the NSW performance monitoring system as a robust evidence basis for productivity and performance improvement is contingent on full participation by all NSW local water utilities (LWUs). The continuing participation of each LWU in the performance monitoring system and each LWU's significant efforts in providing current, accurate and timely data on its performance for each of the past six years and in implementing the *NSW Best-Practice Management Framework* (page 6) are therefore particularly acknowledged.

BLANK PAGE

# 1 INTRODUCTION

This *NSW Water Supply and Sewerage Benchmarking Report* discloses the full suite of NSW water supply and sewerage performance indicators and benchmarking data for all NSW urban water utilities over the past six years. The data is presented in the form of 68 figures and 18 tables and provides comparative information to enable each local water utility (LWU) to improve its productivity and performance through benchmarking its performance against that of similar LWUs.

A companion report, the *2014-15 NSW Water Supply and Sewerage Performance Monitoring Report* (available at [www.water.nsw.gov.au](http://www.water.nsw.gov.au)), discloses the 36 key performance indicators for the NSW water utilities together with the overall statewide performance of the NSW regional water utilities, compares that performance with interstate utilities and explains the 2014 streamlining and simplification of the *NSW Best-Practice Management (BPM) Framework*. With the exception of Appendix A, these matters are not repeated in this *Benchmarking Report*.

The NSW component of the *National Performance Report 2014-15 for Urban Water Utilities* is shown in Appendix F (page 316) of this *Benchmarking Report* while national performance comparisons are shown in Appendix A (page 204) and the characteristics of the Australian urban water sector are discussed in Appendix K (page 364). Independent auditing and validation assure data reliability (page 353).

This *Benchmarking Report* discloses the NSW results for all of the approximately 130 NWI Performance Indicators as shown in note 15 on page 35.

In addition, the Benchmarking Report is a valuable annual **resource kit** and continuous improvement tool for NSW utilities by addressing a broad range of emerging issues and suggested responses, including:

- **Data reliability** of the NSW Performance Monitoring System (pages i, 351, 353)
- **NSW 'one stop shop'** minimises regulatory burden and avoids duplication in reporting (page 3)
- Statewide and national medians (pages 105, 106, 107); water supply **system planning insights** from trends in statewide performance indicators (pages 19, 111, 113, 115)
- National Certification Framework for Treatment Works Operators (pages 36, 280, 360)
- Risk-based drinking water management system (**DWMS**) (page 9)
- Achieving **microbiological compliance** (page 10)
- Boil water alerts (page 10), **lessons learnt** (page 12), distribution system integrity (page 11, 307)
- Assuring safety and integrity of a water supply distribution system (pages 9, 305)
- Water quality sampling locations and frequency (page 235)
- Performance of each LWU's water and sewage treatment works (pages 280, 288)
- BPM (page 5), **NSW BPM Framework** (page 6) and BPM implementation (page 108)
- Cost-effective **renewals** (page 14), **infrastructure asset condition and performance** (pages 126, 130), asset rehabilitation, renewals expenditure (pages 126, 130)
- Leakage (page 15), **Non-revenue water** (NRW) in L/d/connection should be used for tracking performance over time (page 16)
- Benefits of the strong NSW **pricing signals** (page 13), achieving **full cost recovery** (page 22)
- Achieving efficient water use (page 13), total urban water supplied (page 25)
- Greenhouse gases (page 16), **NSW greenhouse gas calculator** (page 339), pollution incident response management plan (**PIRMP**) (page 288), wastewater treatment operators (pages 288, 360)
- Triple bottom line (**TBL**) **Performance Report** (pages 4, 30, 274, 276)
- **Action Plan** (pages 4, 20, 28), 'liveability', emerging issues, financial plan update (page 20)
- Improving performance (page 17), NSW Performance monitoring database (page 213)
- Economic efficiency indicators for four sizes of LWUs (page 21)
- Local Government Integrated Planning and Reporting (**IPR**) Framework, 2010 (pages 7, 8)
- **Software, guidelines, training, tools** and assistance available from DPI Water (pages 8, 9, 12, 13, 16, 22, 24, 36, 356)
- Contents of tables 5 to 18 (page 37), Characteristics of the **Australian Urban Water Sector** (364)
- General notes (page 32), rainwater tanks, liveability indicators (pages 16, 362)

## 2 NSW WATER UTILITIES

This report discloses performance indicators for all NSW urban water utilities, comprising the 105 regional local water utilities (LWUs) together with four metropolitan utilities (Sydney Water, Hunter Water, Water NSW (from January 2015, formerly Sydney Catchment Authority) and Hawkesbury Council). All utilities are listed in the table below in alphabetical order. To facilitate comparisons with similar sized LWUs, tables 5 to 18 of this report appear in order of the number of connected properties served. The number shown beside each utility in the table below indicates the relative size of the utilities on the basis of connected properties served. For example, the table shows '11 Albury City', indicating that Albury City is the 11th largest LWU. LWUs are grouped in four size ranges: over 10,000, 3,001 to 10,000, 1,501 to 3,000, and 200 to 1,500 connected properties.

**Table 1 - NSW water utilities (regional and metropolitan) in alphabetical order**

| No. | Utility                     | No. | Utility               | No. | Utility                  |
|-----|-----------------------------|-----|-----------------------|-----|--------------------------|
| 11  | Albury City                 | 84  | Gilgandra             | 83  | Oberon (R)               |
| 29  | Armidale Dumaresq           | 60  | Glen Innes Severn     | 19  | Orange                   |
| 24  | Ballina (R)                 | 28  | Goldenfields (NO SGE) | 71  | Palerang                 |
| 100 | Balranald (DS)              | 1   | Gosford               | 36  | Parkes                   |
| 21  | Bathurst Regional           | 20  | Goulburn Mulwaree     | 7   | Port Macquarie-Hastings  |
| 23  | Bega Valley                 | 80  | Greater Hume          | 17  | Queanbeyan (R)           |
| 47  | Bellingen                   | 30  | Griffith              | 33  | Richmond Valley          |
| 53  | Berrigan (DS)               | 94  | Gundagai              | 8   | Riverina (NO SGE)        |
| 72  | Bland (NO WS)               | 44  | Gunnedah              | 4   | Rous (BS) (NO SGE)       |
| 78  | Blayney (NO WS)             | 90  | Guyra                 | 3   | Shoalhaven               |
| 89  | Bogan                       | 81  | Gwydir                | 35  | Singleton                |
| 97  | Bombala                     | 76  | Harden (R)            | 52  | Snowy River              |
| 104 | Boorowa                     | 30A | Hawkesbury (NO WS)    |     | Sydney Water             |
| 87  | Bourke (DS)                 | 86  | Hay (DS)              | 13  | Tamworth Regional        |
| 105 | Brewarrina (DS)             |     | Hunter Water          | 69  | Temora (NO WS)           |
| 27  | Byron (R)                   | 37  | Inverell              | 68  | Tenterfield              |
| 91  | Cabonne                     | 106 | Jerilderie (DS)       | 93  | Tumbarumba               |
| 92  | Carrathool                  | 77  | Junee (NO WS)         | 43  | Tumut                    |
| 103 | Central Darling (DS)        | 25  | Kempsey               | 6   | Tweed                    |
| 40  | Central Tablelands (NO SGE) | 70  | Kyogle                | 45  | Upper Hunter             |
| 14  | Clarence Valley             | 59  | Lachlan               | 73  | Upper Lachlan            |

|     |                             |     |                       | 49  | Young (R)                |

R - Reticulator; DS - Dual Supply; BS - Bulk Supplier; NO WS - No water supply; NO SGE - No sewerage

## 3 NSW PERFORMANCE MONITORING SYSTEM

### 3.1 Performance reporting

Performance monitoring and benchmarking are required under National Competition Policy and the National Water Initiative, are important for public accountability and have been strongly endorsed by both the Independent Pricing and Regulatory Tribunal (IPART) and the Productivity Commission.

The State Government promotes continuous productivity and performance improvement to improve the quality and efficiency of services to the NSW community. Performance benchmarking provides valuable comparative data which enables each local water utility (LWU) to review and improve its productivity and performance by examining trends in its performance indicators and by benchmarking its performance against that of similar utilities.

The NSW Performance Monitoring System has been conceived and implemented as a **'one stop shop'**<sup>5</sup> for continuous productivity and performance improvement by the local water utilities (LWUs). The system assures data reliability, **minimises the regulatory burden and avoids duplication** in reporting. Water supply and sewerage non-financial data is obtained from each LWU's annual performance reports for their water and sewerage businesses. These reports are required to be lodged online by each LWU via the NSW Performance Monitoring Database by 15 September each year in order to meet this outcome required by the *Best-Practice Management of Water Supply and Sewerage Framework* (page 6). Financial data is obtained through the Office of Local Government from each LWU's Special Schedule Nos 3 to 7 and Notes 2 and 3 of the Special Purpose Financial Statements of their *2014-15 Annual Financial Statements* (pages 239 to 254). DPI Water obtains the water, sewerage and trade waste charges from each LWU's website. In addition to extensive independent auditing (page 353), DPI Water validates the data in order to assure data reliability (Appendix H on page 351) and provides relevant data to other Government agencies as required (i.e. to ABS, BOM and for key statewide reports including NSW 2021 and the State of the Environment Report).

---

<sup>5</sup> Successful coordination and cooperation with Commonwealth agencies (ABS, BOM) has **avoided duplication in reporting**. The single data collection in the NSW Performance Monitoring System enables DPI Water to develop evidence based policies and guidelines for the LWUs to improve productivity and to:

- Annually provide the approximately 130 NWI performance indicators for the 29 eligible NSW LWUs to the BOM for publication in the National Performance Report ([www.bom.gov.au](http://www.bom.gov.au));
- Annually provide the required data to BOM and ABS; the performance indicator set has been extended by over 45 indicators to meet BOM and ABS requirements;
- Annually provide inputs for statewide reports and submissions, including the State of the Environment Report; and
- Annually prepare:
  - o The *NSW Performance Monitoring Report*, which discloses the overall statewide performance of LWUs and compares that performance with interstate utilities;
  - o This *NSW Benchmarking Report*, which has been prepared by DPI Water since 1986;
  - o A Triple Bottom Line (TBL) Report for each LWU (examples on pages 30 and 31 and pages 274 to 277); and
  - o An Action Plan template for each LWU (example on pages 28 and 29).

The Australian Bureau of Meteorology's Water Amendment Regulations 2012 (No. 1) for Category 7 have been aligned with the national performance reporting through 57 water resources performance indicators (page 19 of the *National Performance Framework* [www.nwc.gov.au](http://www.nwc.gov.au)). All Australian urban water utilities with over 10,000 connected properties are required to report mostly monthly data for those indicators. The NSW Performance Monitoring Database has been extended to enable the 29 eligible NSW LWUs to report this data through the NSW Database. To further avoid duplication, utilities which report these indicators to BOM are exempted from reporting the relevant 33 water resources indicators in DPI Water's annual data collection.

In addition, to avoid duplication of effort by LWUs and to facilitate sound planning and preparation of integrated water cycle management (IWCM) strategies by each LWU, a 20-year water supply and sewerage planning data set of 170 performance indicators has been developed with the key results reported for each LWU in the NSW Benchmarking Report and each LWU's TBL Performance Report since 1994/95. These LWU data sets will minimise the work required for assembling and analysing the necessary water supply and sewerage historical and pricing data by each LWU and are now available to each LWU on request ([urbanwater.ctw@dpi.nsw.gov.au](mailto:urbanwater.ctw@dpi.nsw.gov.au)). [An example data set based on the data reported by Coffs Harbour City Council can be downloaded here.](#)

### 3.2. Benchmarking

Each LWU has the opportunity to improve its performance in areas of apparent under-performance by benchmarking its key work processes in these areas with the work processes of one or two high-performing similar LWUs and implementing the best-practices thus identified. This will provide better customer service, reduced environmental impact and better value-for-money for the community.

In addition, each LWU should undertake 'Syndicate Benchmarking' of its work processes with a group of LWUs with similar characteristics. The best-practices thus identified can then be adopted by other LWUs.

### 3.3 TBL performance reports and action plans

As indicated on page 3, DPI Water provides each NSW local water utility with an annual TBL Performance Report and a template for its Action Plan to Council for its water supply business and for its sewerage business. Each TBL report is an annual "report card" which discloses the LWU's implementation of the outcomes required by the NSW Best-Practice Framework and its performance for over 50 key performance indicators together with the statewide and national medians and the LWU's relative performance against similar sized LWUs. TBL reports and action plans are discussed in section 5.4 on page 20. Example TBL reports are provided on pages 30, 274 and 276 and an example action plan is provided on page 28.

LWUs that implement the 19 planning, pricing and management outcomes required by the *Best-Practice Management of Water Supply and Sewerage Framework* will have demonstrated appropriate, affordable, cost-effective and sustainable piped water supply and sewerage services and compliance with National Competition Policy and the National Water Initiative (refer to section 4 on page 5).

To assist each LWU to gain a quick appreciation of its performance relative to similar sized LWUs, the LWU TBL Performance Report provides a ranking of each LWU's performance for each performance indicator (second shaded column). These rankings are based on the top 20% of LWUs for each indicator being ranked 1 and the bottom 20% being ranked 5 (LWUs in the range 40 to 60% are ranked 3). In addition, rankings are provided for each LWU's performance relative to all LWUs (third shaded column).

LWUs will appreciate that **each performance indicator is a 'partial' indicator only and therefore cannot be interpreted in isolation**. In addition, the rankings are indicative only and do not take into account the wide range of factors that can impact on a LWU's performance, as discussed in section 5.2 on page 17. The aim of ranking each LWU's performance is to assist the LWU in identifying any areas of underperformance in comparison with similar sized LWUs. It should also be noted that a low ranking for some performance indicators does not necessarily mean an LWU is not performing well as there are a number of factors that can impact performance as shown in section 5.2. Eg. the rankings take no account of the impact of utility characteristics (e.g. whether the water supply is fully filtered, whether the utility provides a bulk storage dam and raw water transfer mains, whether the supply is nearby good quality groundwater etc.).

The second page of the TBL reports provide graphs with the LWU's performance and the statewide median over the past 10 years for 15 key indicators (pages 31, 275, 277). These graphs enable the LWU to compare its performance with the statewide median and review trends over time for each indicator, which provide the most meaningful assessment of performance. In addition to the typical residential bill, economic real rate of return, operating cost, employees, main breaks and complaints, indicators include:

- Drought water restrictions, Incidence of unplanned interruptions and average duration of interruptions
- Peak day & peak week water supplied (kL/d/property) and average annual residential water supplied
- Water usage charge (per kL) and Residential revenue from usage charges (%)
- Non-residential sewer usage charge (per kL)
- Effluent recycled (%), Biosolids reuse (%) and sewage that complied with licence (%)
- Capital expenditure (per property)
- Net greenhouse gas emissions for water and sewerage (per property)

Each LWU needs to review its performance using its annual TBL performance reports for water supply and sewerage (pages 274 to 277) and to prepare and implement a sound Action Plan to Council (pages 28 and 29) which addresses any emerging issues following its review and update of its 30-year total asset management plan and 30-year financial plan or any areas of under-performance, as indicated in section 5.4 on page 20.

## 4 BEST-PRACTICE MANAGEMENT

### 4.1 Regulatory framework

Through Goal 21 of the State Plan NSW 2021, the NSW Government's Country Towns Water Supply and Sewerage (CTWSS) program, the Regional Water and Waste Water Backlog (RWWWB) Program, the *Local Government Act 1993* and the *Water Management Act 2000*, the Minister for Lands and Water is responsible for overseeing and monitoring the performance of NSW regional LWUs in the sustainable provision of water supply and sewerage services to the community. The aim of NSW Government policy is for NSW regional LWUs to achieve appropriate, affordable, cost-effective and sustainable water supply and sewerage services.

The State Government will continue to work with the regional NSW water utilities to ensure the community benefits from effective, sustainable and safe piped water supply and sewerage services. DPI Water oversees and monitors utility performance, provides leadership, guidance, software and training (page 9) to the utilities and is the primary regulator for the 105 regional LWUs. DPI Water provides guidance in best-practice planning, pricing, management, operation and maintenance for LWUs.

The then Minister for Energy and Utilities published the '*Best-Practice Management of Water Supply and Sewerage Guidelines*' in 2004. These guidelines consolidated a number of earlier initiatives and are the key driver for reform of planning, pricing and management and for continuing productivity and performance improvement by each utility. The guidelines involve a **locally based decision making and self-regulation regime**, with strategic oversight of LWU implementation of the 19 outcomes required by the guidelines by DPI Water. All LWUs are required to implement these outcomes (footnote 6 on page 7).

In addition, such implementation (page 108) is necessary for the eligibility of LWUs for:

1. the payment of a dividend from the surplus of their water and sewerage businesses to the Council's general revenue
2. financial assistance towards the capital cost of backlog infrastructure (as at 1996) under the CTWSS program or the RWWWB program.

The then Minister for Water Utilities published revised *Best-Practice Management Guidelines* in August 2007 in order to update the Guidelines and address the requirements of the National Water Initiative. The resulting *NSW Best-Practice Management of Water Supply and Sewerage Framework* is shown on page 6.

Utilities which have implemented all of the 19 outcomes required by the *Best-Practice Management Framework*, including a current 30-year IWCMS Strategy and financial plan, are encouraged to pay an 'efficiency dividend' from the surplus of their water supply and sewerage businesses to the Council's general revenue. Refer also to the box on page 22.

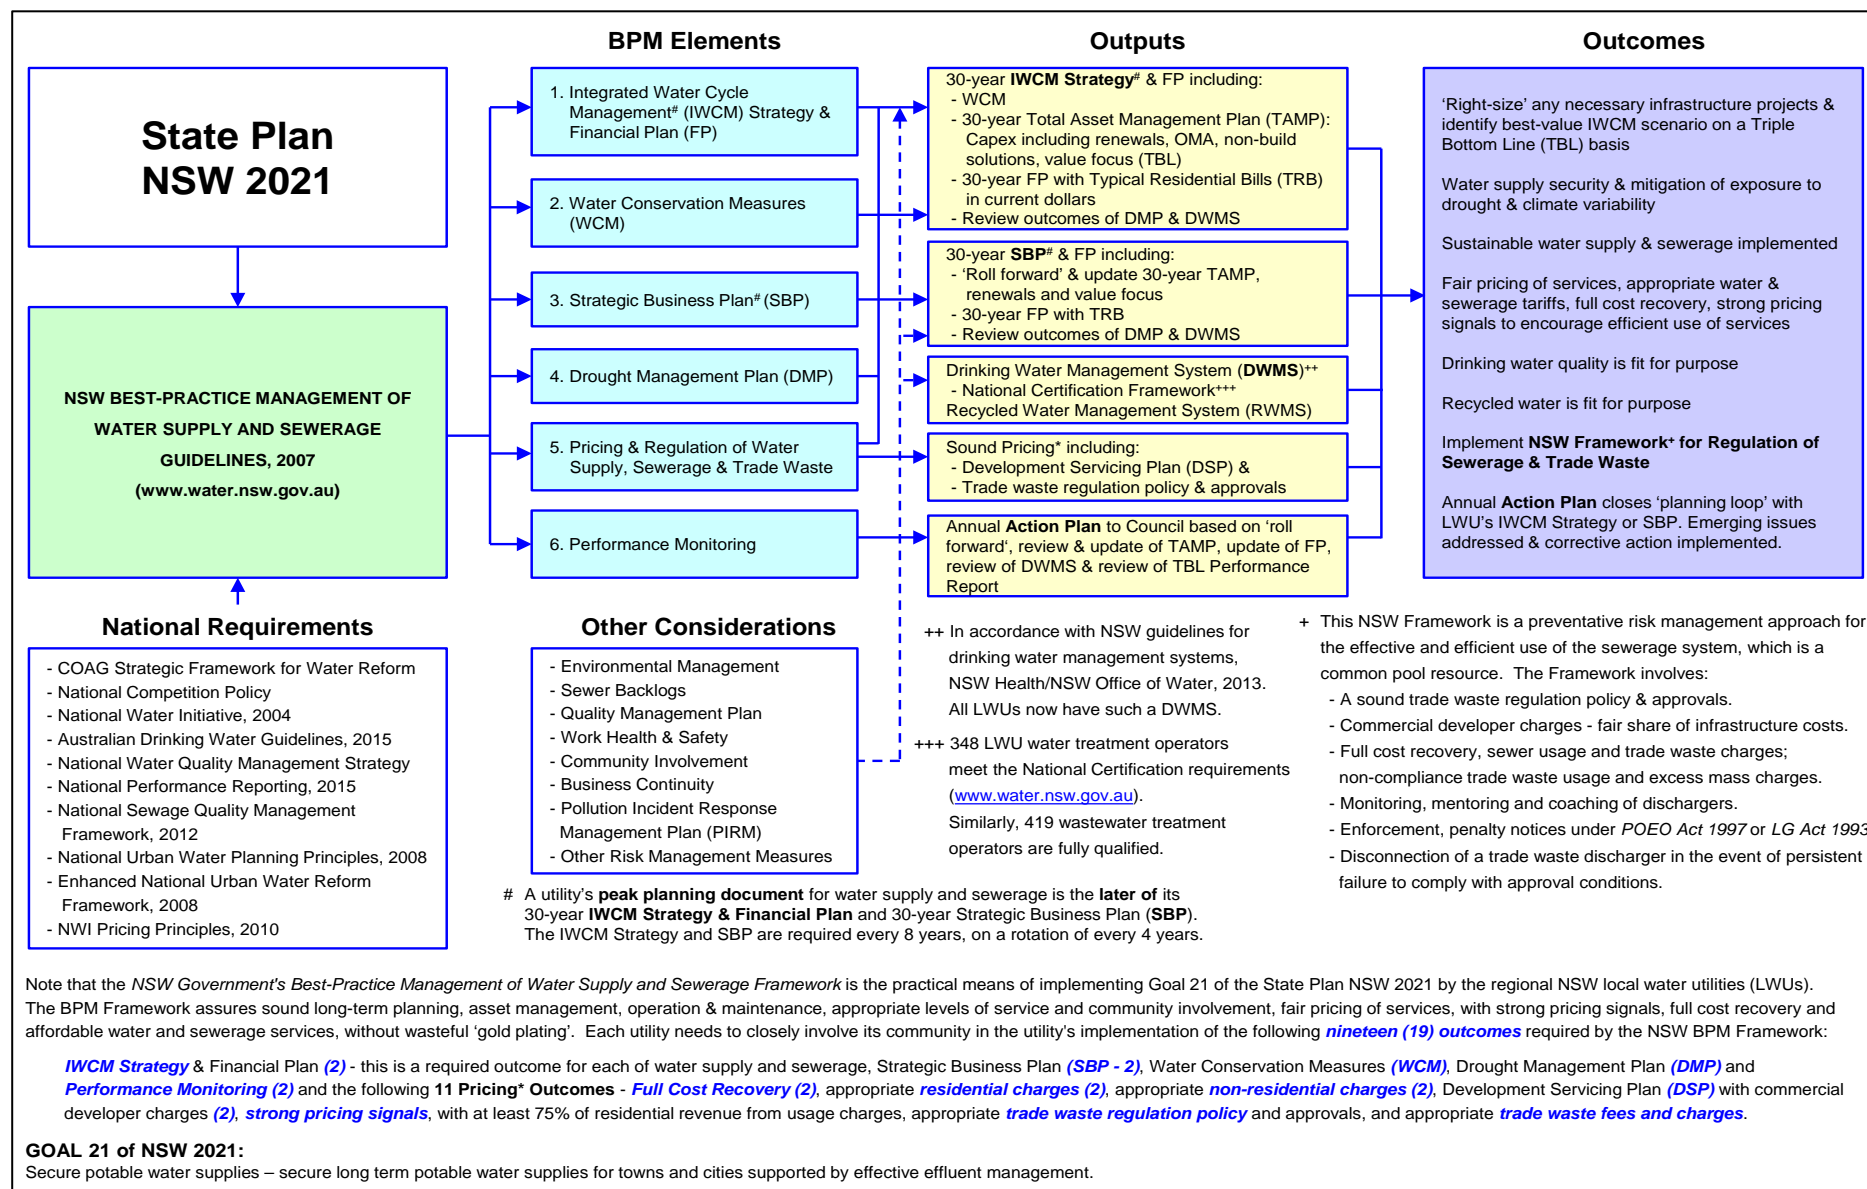

Chart 1 - NSW Best-Practice Management (BPM) of Water Supply and Sewerage Framework

## 4.2 Best-practice management framework

The *NSW Best-Practice Management of Water supply and Sewerage Framework* (page 6) drives reform of planning, pricing and management and continuing improvement in productivity and performance of water and sewerage services in NSW. The Framework identifies the key elements in the delivery of water supply and sewerage services to the community and is available on the DPI Water website ([www.water.nsw.gov.au](http://www.water.nsw.gov.au)).

The *Best-Practice Management (BPM) Framework* shows that utilities which implement the Framework also implement the following national urban water requirements:

- *COAG Strategic Framework for Water Reform*;
- *National Competition Policy*;
- *Australian Drinking Water Guidelines, 2015*;
- *National Water Quality Management Strategy*;
- *The National Water Initiative (NWI), 2004*;
- *National Performance Reporting, 2015*;
- *National Sewage Quality Management Framework, 2012*;
- *National Urban Water Planning Principles, 2008*;
- *Enhanced National Urban Water Reform Framework, 2008*; and
- *The NWI Pricing Principles, 2010*.

In summary, the BPM Framework requires a LWU to prepare strategic business plans and financial plans setting out how it plans to manage these businesses over the next 30 years. This requires negotiation of appropriate levels of service with the community and development of the utility's 30-year total asset management plan (TAMP). This involves a cost-effective capital works program (without wasteful 'gold plating' (page 355)) which discloses each of the growth, improved standards and renewals components, together with a sound operation plan which includes cost-effective non-build solutions, and a maintenance plan.

The strategic business plan must include both the above 30-year TAMP and a sound 30-year financial plan which identifies the resulting Typical Residential Bill (in current dollars) over this period. Each LWU needs to prepare a 30-year strategic business plan, TAMP and financial plan in accordance with the July 2014 Check List ([www.water.nsw.gov.au](http://www.water.nsw.gov.au)). Ninety-four per cent of the NSW LWUs have now prepared such a sound strategic business plan, TAMP and financial plan (column 34 of Table 5 on page 116). These plans cover over 99% of the connected properties in regional NSW. Annual 'roll forward', review and update of the 30-year TAMP and 30-year financial plan and preparation and implementation of an annual Action Plan to Council (page 20) will ensure the long term effectiveness and sustainability of these services.

All the utilities need to implement the 19 outcomes<sup>6</sup> required by the Framework (Table 3 on page 108), which involve the following six interrelated elements:

---

<sup>6</sup> Page 20 of the *Integrated Planning and Reporting Manual for local government in NSW, March 2013* ([www.olg.nsw.gov.au](http://www.olg.nsw.gov.au)) highlights the following more stringent requirements which apply for water supply and sewerage:

### **"Councils responsible for water supply and sewerage infrastructure"**

Councils that have responsibility for water supply and sewerage infrastructure need to comply with the required outcomes and timeframes of the *NSW Government's Best-Practice Management of Water Supply and Sewerage Guidelines, 2007*. These required outcomes include:

- Preparing and implementing a 30 year Integrated Water Cycle Management (IWCN) Strategy
- Preparing and implementing a 20-30-year Strategic Business Plan, Financial Plan and associated asset management plans
- Annual Performance Monitoring, including preparing an annual Action Plan to review the council's performance and to identify and address any areas of under-performance. The review also includes whether the current Typical Residential Bill is in accordance with the projection in the Strategic Business Plan and any proposed corrective action.

The development of both the IWCN Strategy and the Strategic Business Plan require significant community involvement. Further information on these required outcomes is available from the DPI Water website [www.water.nsw.gov.au](http://www.water.nsw.gov.au).

- (1) Integrated water cycle management
- (2) Water conservation and demand management
- (3) Strategic business planning
- (4) Drought management
- (5) Pricing and regulation of water supply, sewerage and trade waste
- (6) Annual performance monitoring.

As set out in Appendix H of the *2014-15 NSW Water Supply and Sewerage Performance Monitoring Report* ([www.water.nsw.gov.au](http://www.water.nsw.gov.au)), the NSW Best-Practice Management Framework has been streamlined in order to minimise the regulatory burden and the cost to LWUs, without diminishing effectiveness or efficiency in achieving the outcomes required by the BPM Framework. This has resulted in deletion of 9 documents previously required over an 8 year cycle. However, the analysis and responses required for the deleted documents have been subsumed into the IWCM Strategy and Financial Plan and the Strategic Business Plan (SBP) and Financial Plan, which will now need to be prepared every 8 years on a rotation of every 4 years (Chart 2).

A LWU's **peak planning document** for water supply and sewerage is the **later of** its 30-year **IWCM Strategy and financial plan** and 30-year **SBP and financial plan**.

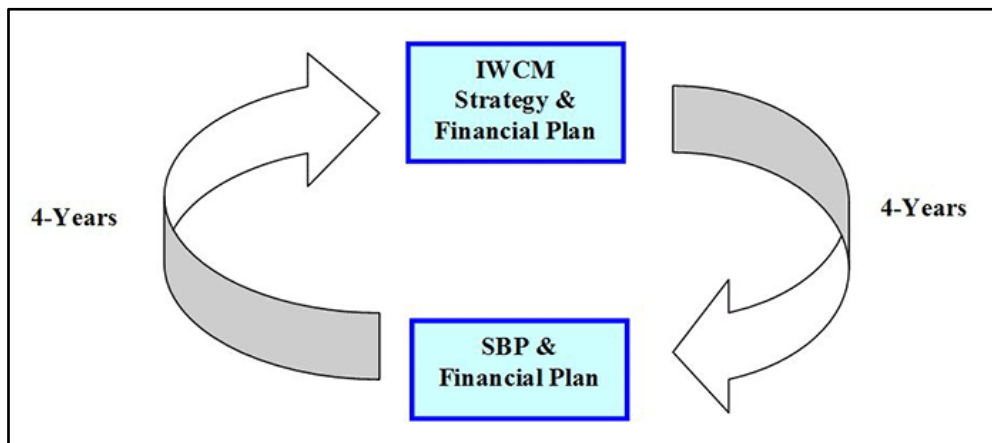

Chart 2 - Preparation timing of IWCM strategy & financial plan and SBP & financial plan

The reported LWU implementation of each outcome required by the Framework is shown in Table 3 on page 108 of this report and the overall level of implementation is shown in column 33 of Table 5 on page 116. A summary of LWU implementation is provided in the *2014-15 NSW Performance Monitoring Report* (page 23 and Figures 21, 22 and 23). Particular attention is required for strategic business planning and financial planning (column 34 of Table 5 on page 116), full cost recovery (columns 29 and 30 of Table 5 on page 116, page 22), residential water supply revenue from usage charges (column 3 of Table 5 on page 116 and Figure 13 on page 51), non-residential sewer usage charges (column 3a of Table 7 on page 146 and Figure 44 on page 81), liquid trade waste fees and charges (column 2 of Table 7C on page 153 and Figure 45 on page 82), trade waste regulation policy and approvals (columns 1 and 3 of Table 7C on page 153), and an IWCM Strategy and financial plan (columns 20 and 21 of Table 8C on page 163).

As noted on page 24 of the *2014-15 NSW Water Supply and Sewerage Performance Monitoring Report*, future IWCM Strategies will need to be in accordance with the July 2014 IWCM Check List ([www.water.nsw.gov.au](http://www.water.nsw.gov.au)) and to include assessment of the secure yield of the utility's water supply in accordance with new climate variability guidelines.

The *Local Government Integrated Planning and Reporting (IPR) Framework, March 2013* (footnote 6 on page 7) has been designed to complement and avoid duplication with the *Best-Practice Management of Water Supply and Sewerage Guidelines*. The inter-relationship of the IPR Framework with the BPM Framework is shown on pages 4, 95 and 99 of the *NSW Water and Sewerage Strategic Business Planning Guidelines, July 2011* ([www.water.nsw.gov.au](http://www.water.nsw.gov.au)). Refer also to pages 106 and 111 of the *2014-15 NSW Water Supply and Sewerage Performance Monitoring Report* ([www.water.nsw.gov.au](http://www.water.nsw.gov.au)).

### Software, guidelines and training

DPI Water provides comprehensive software, guidelines and check lists (pages 7 and 8) to assist LWUs in developing appropriate water supply and sewerage strategic business plans (page 7), financial plans (page 7), community involvement<sup>7</sup>, pricing (pages 7 and 358), including water supply tariffs (page 358), sewerage tariffs (page 358), liquid trade waste fees and charges (page 358), developer charges (page 358), total asset management plans (TAMP - capital works plan, operation plan including non-build solutions and a maintenance plan (page 7)), asset valuation<sup>8</sup>, integrated water cycle management (IWCM) strategies (page 8), water conservation and demand management (page 358), drought management (page 358), assessing future urban water security<sup>9</sup> (page 359), greenhouse gas calculation (page 339) and trade waste regulation policies (page 358).

The NSW Government also provides **nationally certificated training** (page 36) for water utility operators in water treatment, wastewater treatment, fluoridation, dam safety inspection and trade waste regulation ([www.water.nsw.gov.au](http://www.water.nsw.gov.au); [urbanwater.ctw@dpi.nsw.gov.au](mailto:urbanwater.ctw@dpi.nsw.gov.au) or (02) 9842 8508). Training courses on assuring the safety of water supply distribution systems, water treatment operation for engineers and risk management for water recycling projects are also provided.

In addition, the NSW Government provides **update seminars** in water treatment, wastewater treatment, trade waste regulation and best-practice management for updating employee training and skills, which is required at least every 3 years ([www.water.nsw.gov.au](http://www.water.nsw.gov.au)).

## 4.3 Managing drinking water quality

In regional NSW, the public reticulated water supply and sewerage services are the most important factor in protecting public health.

### Risk based drinking water management system

**A safe and reliable drinking water supply is the most essential and critical public health service provided by a Local Water Utility (LWU) to its community.** 99.9 per cent of the 19,400 regional NSW samples tested for *E. coli* in 2014-15 complied with the *Australian Drinking Water Guidelines 2011* (ADWG), (column 9 of Table 5 on page 116, column 71 of Table 12 on page 183, Figure 17 on page 55 and Appendix D1 on page 280).

The risk of contamination of public water supplies due to system integrity failure remains the dominant cause. This can be seen in the table on page 12, which indicates that 86% of the 22 boil water alerts issued by LWUs over the period May 2006 to June 2008 were due to system integrity breaches.

Table 12 on page 183 shows that all 95 LWUs providing a drinking water supply have a risk-based drinking water management system (DWMS), 2 of which have had their system externally assessed. Each DWMS needs to comply with the *NSW guidelines for drinking water management systems*, NSW Health and Office of Water, 2013. Such systems should include reference to sound standard operating procedures (SOP) in accordance with the 3rd paragraph of the box on page 10.

<sup>7</sup> NSW Water and Sewerage Community Involvement Guidelines – Consultation draft, October 2012, NSW Office of Water (available on request from [urbanwater.ctw@dpi.nsw.gov.au](mailto:urbanwater.ctw@dpi.nsw.gov.au)).

<sup>8</sup> NSW Reference Rates Manual for Valuation of Water Supply, Sewerage and Stormwater Assets, 2016, DPI Water ([www.water.nsw.gov.au](http://www.water.nsw.gov.au)).

<sup>9</sup> Assuring future urban water security: Assessment and adaptation guidelines for NSW local water utilities, NSW Office of Water, Draft – December 2013 (available on request from [urbanwater.ctw@dpi.nsw.gov.au](mailto:urbanwater.ctw@dpi.nsw.gov.au)).

<sup>10</sup> While a boil water alert will be necessary to protect the community, for example if a LWU's raw water sources become highly turbid due to major flooding, 86% of recent boil water alerts in regional NSW were found to be due to avoidable system integrity breaches (page 12). LWUs need to follow the NSW Health response protocol if *E. coli* bacteria is found, or if there is failure of the disinfection system, or disinfection is otherwise ineffective e.g. due to poor treated water quality. (<http://www.health.nsw.gov.au/environment/water/Pages/nswhrp-microbiological.aspx>).

### Australian Drinking Water Guidelines (ADWG) 2011

All NSW water supply utilities have now prepared (page 183) a risk-based drinking water management system (DWMS) in accordance with the *NSW guidelines for drinking water management systems*, NSW Health and Office of Water, 2013. Annual review of your DWMS is required (page 20).

A **high priority** for each NSW local water utility is to provide a drinking water supply which:

1. Complies with ADWG for microbiological quality (health related).
2. Complies with ADWG for chemical quality (health related).
3. Maintains the microbiological<sup>6</sup> and chemical drinking water quality through providing appropriate water supply, treatment & distribution infrastructure and carrying out necessary operation and maintenance activities in accordance with sound standard operating procedures (SOP). These include adjusting treatment processes in response to changes in raw water characteristics and regular inspections of service reservoirs in order to detect and repair any defects in the reservoir roof, wall or vermin proofing which may allow contamination of the stored water by birds, wasps, vermin, animals and windborne contaminants (pages 11, 12 and 310).
4. Maintains effective disinfection and the integrity of the utility's water supply distribution systems in accordance with Circular LWU 18 of June 2014 (page 305). The LWU needs to provide a Summary Report to DPI Water (page 315) following its detailed investigation of the integrity of each of its water supply distribution systems.

Guidance on items 3 and 4 above is provided in Appendix E on page 305, which sets out a robust basis for assuring the safety of a water supply. Each LWU needs to ensure that the standard operating procedures (**SOP**) for its water supply systems **meet** the minimum monitoring **requirements in Appendix E** for ensuring effective disinfection of the source water and assuring the integrity of its distribution system in order to prevent contamination of the supply.

In view of their importance for ensuring public health protection, any failures to achieve microbiological compliance in the last 2 financial years or any 'boil water alerts' in the last 18 months, the corrective action implemented and whether it was successful must be reported in your LWU's annual Action Plan to Council (note 4 on page 29). Refer also to page 24.

Assistance available: [urbanwater.ctw@dpi.nsw.gov.au](mailto:urbanwater.ctw@dpi.nsw.gov.au) or Manager Water and Sewerage on (02) 9842 8495 or your Regional Water and Sewerage Treatment Officer (refer to page 36).

### Boil water alerts and lessons learnt

Information provided by the Water Unit of NSW Health has revealed that 22 boil water alerts were issued by LWUs between May 2006 to June 2008 (refer to the table on page 12). The vast majority of these alerts were due to system integrity breaches, which resulted in failure of the water utility to meet the microbiological water quality requirements of ADWG. The alerts were issued by LWUs of all sizes, with ten alerts issued by LWUs with over 10,000 connected properties, three by utilities with 3,001 to 10,000 properties and nine by utilities with under 3,000 properties. A total of 24,500 people (1.4 per cent of the 1.8 million people served) were affected by the boil water alerts.

Photos 1 to 5 on page 11 show examples of failure of distribution system integrity in regional NSW.

However, it is acknowledged that 14% of the alerts were due to pumping of highly turbid raw water during flooding, which was mostly beyond the control of the LWU, unless the LWU had access to alternate water sources, or had imposed water restrictions on residents to allow it to avoid pumping during such floods.

The lessons on page 12 have been integrated into the guidance in Appendix E on Page 305 to provide a robust basis for assuring the safety of a water supply. As noted in the box above, each LWU needs to ensure that the standard operating procedures (**SOP**) for its water supply systems **meet** the minimum monitoring **requirements in Appendix E** for ensuring effective disinfection and assuring the integrity of its distribution systems in order to prevent contamination of the supply.

## Examples of Failure of Integrity of Distribution Systems

**Photo 1** shows the **hatch** of a 20m high service reservoir, which has inadvertently been **left open** for a few weeks. The result was repeat detections of *E. coli* in the reticulated water supply and the need to issue a boil water alert.

Photo 1 - Service reservoir hatch left open

**Photos 2 and 3** are underwater photos in the above service reservoir showing evidence of contamination by birds - **bird eggs & dead birds**.

Photo 2 - Bird eggs in reservoir

Photo 3 - Dead birds in reservoir

**Photo 4** is a service reservoir where the **mesh openings** are **too large** and the roof design is deficient, allowing the entry of small birds, rainwater and windblown material to contaminate the stored water. The reservoir roof needs to be modified so that roof runoff and windblown material cannot contaminate the stored water. **Photo 5** shows mesh openings that are also too large,

allowing entry of vermin, such as wasps and windblown material.

Photo 4 – Deficient reservoir roof design

Photo 5 - Large mesh openings on reservoir

The continued detection of *E. coli* in reticulated water supplies and boil water alerts in 2012 and 2013 have highlighted the need for a strategic approach for assuring the integrity of the distribution system to prevent contamination of a water supply that has been effectively disinfected. The recommended approach in Appendix E on page 305 was developed by DPI Water and NSW Health in consultation with the NSW Water Directorate and LWUs to provide a robust basis for assuring the safety of a water supply. As noted in the box on page 10, each LWU needs to review its present standard operating procedures (SOP) to ensure they address the minimum requirements in Appendix E for achieving safe water supplies:

Barrier 1 – **Effective disinfection** to kill, inactivate or remove pathogens in the water supply prior to distribution.

Barrier 2 – Ensure **distribution system integrity** to prevent contamination.

Barrier 3 – **Maintain free chlorine residual** in the water in the distribution system where practicable, to help protect against minor contamination and as an indicator of a potential breach in distribution system integrity.

## Summary of boil water alerts in regional NSW – May 2006 to June 2008

| No. of alerts | Reason for alert  |
|---------------|---|
| 17            | Defects in the reservoir roof, wall or bird proofing which allowed bird entry through gap in reservoir roof or windblown material to contaminate the treated water. |
| 3             | Highly turbid raw water, no filtration plant, ineffective disinfection. <sup>11</sup>   |
| 1             | Failure to properly clean and disinfect the main after replacement of valves and fittings.  |
| 1             | Backflow in the mains due to inadequate backflow prevention device.   |

### Notes:

1. The information in the above table was provided by NSW Health's Water Unit or obtained by DPI Water from the relevant LWU.
2. Duration of boil water alerts generally ranged from two days to 25 days with a median of nine days.
3. Total population affected by the 22 boil water alerts was 24,500.

These incidents highlight that 86% of the alerts were due to breaches in distribution system integrity such as the entry of birds or windblown material through **defects in the reservoir roof, wall or bird proofing**. They also show that a number of LWUs have been using reactive measures to protect public health. Preventive management in accordance with Appendix E provides a robust basis for assuring the safety<sup>10</sup> of a water supply and would have avoided the need for 86% of the above boil water alerts.

A number of important lessons have been learnt from the above boil water alerts as tabulated below:

### Lessons learnt<sup>12</sup> from boil water alerts

| Practices                          | Lessons  |
|------------------------------------|--|
| Management                         | <ul style="list-style-type: none"> <li>Carry out regular preventative maintenance and calibration of chlorinators and associated equipment.</li> </ul>   |
| Disinfection                       | <ul style="list-style-type: none"> <li><b>Ensure effective disinfection of the source water</b> prior to distribution.</li> <li>Continuous monitoring<sup>13</sup> of the chlorination system to warn of any interruptions/failures of the chlorinator.</li> <li>Carry out chlorine demand tests on a regular basis and after a change in raw water characteristics; adjust chlorine dosage as necessary.</li> </ul>   |
| Storage (service reservoirs/tanks) | <ul style="list-style-type: none"> <li>Ensure entry hatches to service reservoirs are secure and that hatches are not left open; particular care is required if third parties (e.g. telephone companies) have been given access to your LWU's reservoirs.</li> <li>Regular physical inspection is essential in order to <b>detect</b> and <b>repair</b> any design deficiencies (eg. photos 4 and 5 on page 11) or <b>defects in the reservoir roof, wall or bird proofing</b> of each reservoir. Early repairs must be effected to correct any defects and <b>prevent contamination</b> of the stored water by birds, vermin or windblown material (pages 310, 315).</li> </ul> |
| Free chlorine residual             | <ul style="list-style-type: none"> <li><b>Maintain a minimum free chlorine residual of about 0.2 mg/L</b> throughout the water supply distribution system<sup>14</sup> (including extremities where practicable).</li> </ul>   |
| Backflow prevention                | <ul style="list-style-type: none"> <li>Ensure appropriate backflow prevention devices are installed and are properly maintained (including any rain water tanks used for toilet flushing).</li> </ul>  |
| Source monitoring                  | <ul style="list-style-type: none"> <li>Monitor the raw water regularly and after storm events for evidence of changes in colour or turbidity.</li> <li>Chlorine demand tests should be carried out on a regular basis.</li> <li>Adjust chlorine dosing as necessary.</li> </ul>  |

<sup>11</sup> Guidance on ensuring effective disinfection and assuring the integrity of the distribution system to prevent contamination of the supply is provided in Appendix E on page 305. This guidance incorporates the above lessons.

<sup>12</sup> The above lessons include learnings from the investigation of several boil water alerts in 2012 and 2013. The investigations have identified instances of bird droppings on reservoir roofs contaminating the stored water through unplugged drill holes in the reservoir roof and windblown material 306, each LWU should **within the next 12 months physically inspect** each reservoir roof, wall and bird proofing using lifting equipment in order to identify and repair such defects and provide a Summary Report (page 315) on findings and the corrective action implemented. This action is essential in order to proactively assure distribution system integrity and to prevent contamination of the water supply.

<sup>13</sup> Monitoring requirements must be clearly documented in each LWU's Drinking Water Management System with appropriate responsibility & authority assigned to suitably **trained officers**. Refer to Appendix E on page 305, section 6.2 on page 36 & page 24.

<sup>14</sup> Maintaining such a **chlorine residual** is Barrier 3 in the recommended **multi-barrier approach** for assuring drinking water quality (page 312).

## Outcomes of reservoir and distribution system integrity inspections

The following 23 LWUs have provided DPI Water with a Summary Report (refer to page 315) on the outcomes of their examination and rectification of deficiencies in reservoir and distribution system integrity pursuant to Circular LWU 18 (page 305).

Armidale, Bogan, Bourke, Brewarrina, Cooma Monaro, Coonamble, Dubbo, Gilgandra, Kempsey, Lismore, MidCoast Water, Nambucca, Narromine, Orange, Rous Water Shoalhaven, Singleton, Tenterfield, Walcha, Warren, Warrumbungle, Wingecarribee and Wyong.

Armidale, Rous and Wingecarribee have rectified the identified deficiencies and the remainder have scheduled the necessary corrective action in their short term work plan.

## 4.4 Achieving efficient water use

Achieving efficient water use is a key responsibility for each water utility. As shown on page 9 of the *2014-15 NSW Water Supply and Sewerage Performance Monitoring Report* (available at [www.water.nsw.gov.au](http://www.water.nsw.gov.au)) and Figure 33 on page 111, the regional NSW utilities have reduced the average annual residential water supplied per property by 50 per cent over the past 24 years. Refer also to Figure 26 on page 64.

Many LWUs have reduced their average annual residential water supplied by over 50 per cent over this period through community education, water conservation, water efficient appliances and providing appropriate pricing signals to encourage efficient water use. In particular, as shown on graph 3 on page 205 and Figure 12 on page 50, the first step water usage charge has risen to 226 c/kL. This provides a strong pricing signal and is among the highest of all the other Australian utilities.

LWUs are reminded that Circular LWU 11 of March 2011 (refer also to the box on page 22) has removed the need for use of inclining block tariffs by LWUs. **The NSW Government encourages<sup>15</sup> LWUs to use a 2-part tariff with a uniform water usage charge per kL for all water use.** IPART has implemented such tariffs for Sydney, Hunter, Gosford, Wyong and Essential Energy.

The median revenue from residential water usage charges was 72 per cent (Figure 13 on page 51). However, affordability has been maintained through the \$593 (Jan 2016\$) water Typical Residential Bill, which has increased by only 18% in real terms over the past 20 years (graph 5 on page 206).

The strong pricing signals provided by the NSW LWUs have enabled them to avoid over \$1B in capital expenditure over the last decade for augmenting water supply headworks and treatment capacity and the associated increases in their typical residential bills. The strategic benefits of the strong pricing signals implemented by the NSW water utilities are highlighted on page 5 of the *2014-15 NSW Water Supply and Sewerage Performance Monitoring Report* (available at [www.water.nsw.gov.au](http://www.water.nsw.gov.au)).

Any LWU which is not achieving the required revenue from residential water usage charges (column 3 of Table 5 on page 116) should develop an appropriate tariff in order to provide the necessary pricing signals to its customers and achieve the above benefits of efficient water use in its area. LWUs also continue to need to achieve full cost recovery (box on page 22 and column 29 of Table 5 on page 116). Assistance is available from DPI Water ([Dilip.Dutta@dpi.nsw.gov.au](mailto:Dilip.Dutta@dpi.nsw.gov.au) or (02) 9842 8499).

The peak day water supplied per property is shown on page 46, Figure 33c on page 111 and on each LWU's TBL Performance Report (graph 33c on page 31). Figure 33c on page 111 shows a 61% reduction in the statewide median peak day water supplied per connected property over the past 15 years. This can provide major cost savings through avoiding or deferring the need to augment the capacity of water treatment works, service reservoirs, pumping stations and trunk mains. Refer to section 5.3 on page 19.

## 4.5 Asset management

### Infrastructure Renewals

As noted on page 7, assessment of infrastructure renewals requirements is a critical element of a utility's asset management plan, which must be documented in the utility's 30-year strategic business plan and

<sup>15</sup> Refer to page 15 of the NSW Government's submission of May 2011 on the Productivity Commission Draft Report 'Australia's Urban Water Sector, April 2011' (available at [www.pc.gov.au](http://www.pc.gov.au) and [www.water.nsw.gov.au/urban-water/default.aspx#draft](http://www.water.nsw.gov.au/urban-water/default.aspx#draft)).

financial plan. Details of each LWU's asset rehabilitation activities and renewals expenditure are provided in Tables 10 and 15 on pages 172 and 192 respectively, as well as Tables 5C and 5D on pages 126 and 130. These are also shown on notes 9 and 10 respectively of each LWU's Water and Sewerage TBL Reports (pages 274 and 276).

Renewals programs for LWUs vary in complexity from a reactive approach (no renewals, repairs (maintenance) undertaken as required) to development of a comprehensive total asset management plan (TAMP). A TAMP is essential as it forms the foundation for a LWU's 30-year strategic business plan. LWUs therefore need to continue to develop and annually update their TAMP and financial plan.

As noted on page 7, the 30-year TAMP comprises an operation plan, which includes cost-effective non-build solutions, a maintenance plan and a capital works plan (involving works for improved levels of service, works to service growth and a **30-year renewals plan**<sup>16</sup>).

For a water supply distribution system, for example, an operation plan would be required as part of the LWU's risk management. The operations review needs to include:

- **An economic analysis** – identifies pipelines where renewal is more economic than continuing with repairs. Takes into account the impact of pipe failure (e.g. failure of a pipeline in the CBD has more impact than failure of a pipeline on the outer edge of the system).
- **A reliability analysis** – identifies pipelines where renewal is required for reliability (to ensure performance requirements with regard to supply interruptions can be achieved).
- **A capacity review** – identifies pipelines where augmentation or replacement is required (to maintain the required pressure or flow).
- **A leakage analysis** – identifies whether leakage reduction is economically warranted.

The driver of renewals expenditure is the ability to cost-effectively meet the LWU's performance requirements, i.e. the levels of service and the associated Typical Residential Bill (TRB) negotiated with the community. Other relevant considerations are the condition and age of the assets.

For water supply and sewerage, it is misleading to measure annual renewals expenditure on the basis of a percentage (say 1 or 2 per cent) of the current replacement cost of assets. Rather, the bulk of renewals expenditure will be required towards the end of the economic life of an asset (e.g. a new water main with an economic life of 80 years would be expected to have minimal renewal expenditure before year 80). Therefore, LWUs should ensure that their 30-year financial plan includes capital expenditure, including renewals, identified in a soundly based total asset management plan<sup>17</sup>. They should also annually 'roll forward', review and update their 30-year TAMP for projects completed, modified or deferred and input the results, together with their latest annual financial statements to prepare an update of their 30-year financial plan. Any warranted corrective actions, including those from the review of the LWU's DWMS and any Section 61 Reports needs to be included in the LWU's annual Action Plan to Council (page 20).

Funding in the financial plan involves an appropriate mix of the utility's annual income, accumulated cash and investments and borrowings. As noted on page 23, your LWU's Action Plan must report on whether the Typical Residential Bill (TRB) is consistent with the projection in the later of your LWU's 30-year strategic business plan and financial plan and 30-year IWCM Strategy and financial plan.

As shown on page 59 and graph 10 on page 207, water main breaks for NSW LWUs have remained much lower than all the other states and metro utilities, indicating good water main asset condition.

Further information on the development of a cost-effective asset renewal plan can be obtained from DPI Water ([Dilip.Dutta@dpi.nsw.gov.au](mailto:Dilip.Dutta@dpi.nsw.gov.au) or (02) 9842 8499). Information on asset valuation and economic life can be obtained from the 'NSW Reference Rates Manual for Valuation of Water Supply, Sewerage and Stormwater Assets', 2016 ([www.water.nsw.gov.au](http://www.water.nsw.gov.au)) and broad guidance on asset management is provided in section 10 of the *NSW Water and Sewerage Strategic Business Planning Guidelines*, NSW Office of Water, July 2011 ([www.water.nsw.gov.au](http://www.water.nsw.gov.au)).

<sup>16</sup> DPI Water will be preparing tools and guidance materials on identifying and implementing a cost-effective & robust 30-year renewals plan. Refer also to Item 7F of the July 2014 Strategic Business Planning Check List ([www.water.nsw.gov.au](http://www.water.nsw.gov.au)).

<sup>17</sup> Refer to pages 84 and 85 of the *2010-11 NSW Water Supply and Sewerage Performance Monitoring Report* ([www.water.nsw.gov.au](http://www.water.nsw.gov.au)).

## Leakage

Water leakage and apparent losses are often poorly defined and poorly understood and, in general, water utilities have a relatively limited awareness of the true value of these two parameters within their water supply systems. The International Water Association (IWA) has adopted the following terminology:

- **Real losses** are physical water losses from the potable water supply distribution system up to the point of customer metering. They can occur through leaks, bursts and reservoir overflows. Recent LWU results are shown in column 41e of Table 10 on page 172 and Table 10A on page 175.
- **Apparent losses** reflect errors in measurement and/or the documentation process. They generally consist of customer use which is not recorded due to metering error (mostly under-registration of worn customer meters), incorrect assumptions of unmeasured use or unauthorised consumption (illegal use). (Refer to columns 4 to 6 of Table 8A on page 159).
- **Water losses** = Real Losses (mostly leakage) + Apparent Losses (meter errors, illegal use).
- **Non-revenue water (NRW)** consists of Water Losses plus unbilled authorised consumption (column 41f of Table 10 on page 172, column 9 of Table 8 on page 155 and Figure 29 on page 67. Unbilled authorised consumption (column 8b of Table 8 and column 9 of Table 8A on page 159) may or may not be metered and may include firefighting and mains flushing. Any watering of parks and gardens (column 6 of Table 8) should be metered and billed by each LWU.

Leakage management is an essential element of asset management. Leakage cannot be totally avoided due to the large no. of service connections in a water supply network (column 18a of Table 9 on page 169). Small 'weeps' in connections result in unavoidable losses and these losses increase with higher system pressure.

Leakage and water losses have historically been reported as a percentage of water supplied. Although this identifies the significance of these parameters in relation to the total water supplied, it is not helpful in monitoring the effectiveness of a utility's performance in reducing losses and is perversely affected by reductions in water consumption and water restrictions due to drought. In addition, these indicators do not measure the efficient management of leakage in a distribution system because they take no account of multiple properties, density of service connections (Indicator WB30 on page 213), length of mains, customer meter location in relation to the property boundary or the operating pressure. Water loss in L/d per connection is recommended by IWA as the best traditional basic technical indicator for real losses, although it does not account for other factors such as length of main or operating pressure. In particular, reductions in operating pressure have been shown to greatly reduce system leakage.

The Infrastructure Leakage Index (ILI) has been proposed as an indicator which measures how effectively real losses are being managed at the current operating pressure while accounting for other influential factors such as length of mains, number of service connections and customer meter location. The ILI is calculated from the ratio of the Current Annual Real Losses (CARL) to the Un-Avoidable Real Losses (UARL). CARL is the annual real losses divided by the number of service connections and percent of time the system is under pressure. UARL is a function of length of mains, number of service connections and average system pressure.

An ILI of 1.0 indicates that only unavoidable losses are occurring and that optimum leakage management is in place. There is of course a significant cost associated with operating a system with an ILI of 1.0 and this may not be warranted. An ILI of less than 1.0 is meaningless. When interpreting ILI data it should be noted that many of the inputs are imprecise. While an ILI of 2.2 appears to be better than one of 2.5, in practice it is likely both represent similarly well managed systems.

The ILI is recommended by the International Water Association for international comparisons of water utilities. The National Performance Framework ([www.nwc.gov.au](http://www.nwc.gov.au)) has adopted the ILI as a measure of leakage (NWI Indicator A9) and DPI Water has reported the ILI for each LWU since 2005-06 (column 41b of Table 10 on page 172). DPI Water will also continue to report **leakage as L/d per connection** (the relevant measure for utilities with over 20 connections/km, which is the vast majority of NSW LWUs) (column 41 of Table 10 on page 172, Figure 28 on page 66), which is the best measure **for tracking a LWU's leakage performance over time**. This indicator (A10) is also preferred in the National Performance Framework. Similarly, as indicated in note 9 on page 33, **Non-Revenue Water (NRW)** in L/connection/d) should be used for tracking a utility's performance over time. Refer also to column 41f of Table 10 on page 172 and Figure 29 on page 67.

Analysis by the International Water Association has demonstrated that the Australian urban water utilities (based on results reported in the National Performance Report 2007-08 for urban water utilities) are by far<sup>18</sup> the best performing urban water utilities in the world for minimising leakage and real losses.

The statewide median real water loss is 60 L/connection/d, which is lower than the national Median of 76 L/connection/d (page 119 and Figure 28 on page 66 and page 208). As shown in Table 10 on page 172, 74 LWUs have recently carried out water loss management, including leakage testing, analysis and leakage reduction. The Regional NSW Water Loss Management Program (Table 10A on page 175) has resulted in reductions in the average water losses for the 68 participating LWUs from 154 to 92 L/connection/d, or from 16% to 10% of the potable water supplied, a total saving of 5,500 ML/a. Real water losses 'before' and 'after' the Regional NSW Water Loss Management Program are shown in columns 8 to 13 of Table 10A on page 175 for each of the 68 LWUs.

### Greenhouse gases

The National Water Initiative requires LWUs to report both direct and some indirect greenhouse gas (GHG) emission estimates (columns 35a to 35d of Table 5B on page 123 and pages 115 and 277). The **NSW greenhouse gas calculator** has been developed by DPI Water to assist LWUs. The calculator has been provided to all LWUs, as well as to interstate utilities, and is included in **Appendix G** on page 339. Direct emissions are produced from sources within the boundary of an organisation and as a result of that organisation's activities. Direct emissions mainly arise from the following activities:

- Generation of energy, heat, steam and electricity.
- Manufacturing processes.
- Transportation of materials, products, waste and people.
- Fugitive emissions (eg. Intentional or unintentional emissions from natural gas leaks, joints and seals).
- On-site waste management such as emissions from landfill sites.

Eg. LWUs with a car fleet should report emissions – petrol used in those vehicles as direct emissions.

Emission factors for calculating direct emissions are generally expressed in the form of mass of GHG emitted per unit of energy (kg CO<sub>2</sub>/GJ). Factors are used to calculate GHG emissions by multiplying the factor (e.g. kg CO<sub>2</sub>/GJ energy in petrol) with activity data (eg. kL x energy density of petrol used).

Indirect emissions are emissions generated in the wider economy as a consequence of the LWU's activities, but which are physically produced by the activities of another organisation (eg. off-site waste disposal).

Emission factors and examples of the calculation of GHG emissions are provided by the Department of Climate Change and Energy Efficiency – National Greenhouse Accounts (NGA) Factors (<http://www.climatechange.gov.au/publications/greenhouse-acctg/national-greenhouse-factors.aspx>).

It is noted that many opportunities for reducing greenhouse gas emissions are often missed because their financial attractiveness is masked by not considering their full costs and benefits.

### Rainwater Tanks and Water Sensitive Urban Design

Appendix J on page 362 shows a total of 39,000 residential rainwater tanks reported by 33 LWUs. The typical rainwater tank volume is 3 to 5 kL. The ten LWUs which reported at least 1,000 rainwater tanks were Wyong (10,000), Gosford (9,032), Singleton (2,149), Bega Valley (1,800), Tweed (1,873), Coffs Harbour (1,886), Mid-Western Regional (1,588), Gwydir (1,500), Armidale (1,342) and Young (1,000).

In 2014-15, 17 LWUs released a total of 2,200 water sensitive urban design (WSUD) residential lots, compared to a total of 1,700 in 2013-14.

In addition, Appendix J shows the 20 LWUs which have a Regional Development Control Plan which requires 'liveable towns and cities' development or WSUD for new developments. Appendix J also shows that 216km of stormwater channels are managed under WSUD principles.

<sup>18</sup> Alan Lambert "The Future of Leakage Indicators" presentation to the National Performance Report 2008-09 Definitions Review and Planning Workshop, 11 February 2010.

## 5 IMPROVING PERFORMANCE

### 5.1 Performance review

A utility's **overall aim** for its water supply and sewerage businesses should be to provide value for money for its community by delivering the levels of service negotiated with the community at the lowest sustainable Typical Residential Bill (TRB). This is done through sound planning, pricing and efficient operation, setting cost-reflective developer charges, non-residential charges and liquid trade waste fees and charges and then minimising its TRB in current dollars on a sustainable basis. As noted on pages 5 and 22, utilities which have implemented the *Best-Practice Management Framework (BPMF)* are encouraged to pay an 'efficiency dividend' to the Council's general revenue and should also include the dividend amount.

In practice this means reviewing whether your performance indicators under 'Social', 'Environmental' and 'Economic' are satisfactory. If they are not, you need to develop options to raise your levels of service and consult the community to establish the option which provides the best value for money.

After undertaking a review of indicators and trends in performance, each LWU should include any warranted corrective actions in its annual Action Plan to Council using the Action Plan template provided by DPI Water (see section 5.4 on page 20).

**The typical residential bill is the principal indicator of the overall cost** of a water supply or sewerage system (columns 4, 5 and 6 of Table 5 on page 116, Figure 1 on page 38, column 8 of Table 6 on page 126, Figure 10 on page 48, column 8 of Table 7 on page 146, Figure 42 on page 79) and is the annual bill paid by a residential customer using the utility's average annual residential water supplied (column 17 of Table 5 on page 116, Figure 26 on page 64). A critical element in minimising the typical residential bill and providing value for money for the community is to ensure each utility's operating cost (OMA – operation, maintenance and administration) (columns 31 and 32 of Table 5 on page 116, column 67 of Table 11 on page 180, Figures 33, 34, 35 on pages 70, 71, 72) is efficient.

LWUs should take note of section 5.2, which identifies the many factors that may contribute to apparent under-performance.

### 5.2 Factors impacting on performance

When comparing reported performance, utilities should take account of the wide range of factors which can impact on their performance and typical residential bill, which is the principal indicator of the overall cost of a water supply or sewerage system. Such factors can produce a fundamental difference in performance.

For example, in the case of water supply, a utility which provides full water treatment and has its own bulk storage dam and raw water transfer mains and channels will have a much higher capital and operating cost structure than a utility which has a nearby good quality groundwater supply. Each utility can improve its performance by taking account of such factors and comparing its performance with utilities having similar characteristics (refer to pages 18 and 19).

Other factors include the extent of the services provided by each utility, geography, climate etc. An understanding of these factors is vital for valid interpretation of performance data.

**The most meaningful performance indicators are the trends over time for each utility.** This involves identifying any trends in the indicators on page 2 of your TBL Performance Report (page 31) and comparing your results with the statewide and national median values and the top 20%. For the indicators on page 1 of your TBL Report, particular note should be taken of indicators that appear to be less than satisfactory, i.e. with a ranking of 4 or 5. However, even with such analysis, care needs to be exercised due to changes in the factors over time. For comparison between utilities, each utility should benchmark its performance with utilities having similar characteristics.

Some of the factors which can affect the performance of a water supply system are outlined on the following page.

### Utility characteristics

- (1) **Climate** – the variability of rainfall is a key driver of water supply costs in relation to water demand and drought security. This will affect both capital and operation and maintenance costs. For example, the average annual residential water supplied in inland NSW is 68% higher than coastal NSW.
- (2) **Geography** – Geology, geography and topography can significantly affect water transportation costs.
- (3) **Asset life cycle** – Recently constructed systems have much lower maintenance costs compared to older systems. In addition, as noted on page 14, renewal costs are typically nil until the asset is approaching the end of its useful life. They also have higher Typical Residential Bills and loan payments. Refer also to page 14.
- (4) **Development density** – Distribution networks are a major investment component of a water supply system. The density of urban development has a large effect on the infrastructure cost (e.g. the number of properties served per km of main has a Statewide median of 31, but has a range of 3 to over 70 (column 26 of Table 9 on page 169, Figure 6 on page 43)). A further key factor is the number of small discrete urban water supply systems operated by the utility which tend to greatly increase both the capital cost<sup>19</sup> and the operating cost per property.
- (5) **Water resources availability and proximity** – can incur significant capital and operating costs. Such costs would not apply for utilities relying on groundwater or those receiving a regulated supply from a State Water dam (note 12 on page 34).
- (6) **Size of LWU** – there are significant economies of scale for large utilities, particularly the capital cost of infrastructure and the operation and maintenance costs of water treatment works (page 21 and Figure 37 on page 74). Refer also to footnote 19 below.

### Social – levels of service

- (7) **Service standards** – Increasingly stringent standards for water quality and environmental health may result in additional capital and operation and maintenance costs to the utility. Similarly, requirements for minimum pressures or rates of flow can also affect costs.
- (8) **Filtered supply** – will incur both a high capital cost and a high treatment cost per property for small water supply systems (utilities without ‘unfiltered’ or ‘groundwater’ after their name in Tables 3, 5 and 6 have water treatment involving at least filtration and disinfection for over 50 per cent of their water supply) (note 13 on page 34).

### Environmental

- (9) **High average annual residential water supplied per property** (column 17 of Table 5 on page 116, column 56a of Table 10 on page 172, Figure 26 on page 63, Figure 33 on page 111) – such utilities should examine opportunities for reducing the water supplied through water conservation and implementation of best-practice water pricing. Achieving efficient water use is a key responsibility for a water utility. As shown on page 111, the regional NSW utilities have reduced the average annual residential water supplied per property by 50 per cent over the past 24 years. Many utilities with 3,000 to 10,000 connected properties are providing relatively weak pricing signals to their residential customers through their water usage charges. These utilities should review their tariff structure to provide appropriate pricing signals. Assistance is available from DPI Water in this regard (page 13). Refer also to section 4.4 on page 13 and section 5.3 on pages 19 and 20.

### Economic

- (10) **High loan payment per property** – indicates a relatively high capital cost per property, recent construction of significant capital works or use of short-term loans. **Twenty-year loan terms are strongly recommended** in order to minimise the required Typical Residential Bill (TRB), which avoids unfairly burdening existing customers and facilitates **inter-generational equity**. Refer also to page 14 of the *2014-15 NSW Performance Monitoring Report* ([www.water.nsw.gov.au](http://www.water.nsw.gov.au)).

<sup>19</sup> The lack of economy of scale and the lower development density in small towns result in a **capital cost per property** for providing water supply trunk mains to a town of 300 properties being typically over **3 times** that required for servicing a contiguous city of 15,000 properties. The capital cost per property for other structures such as water treatment works, service reservoirs, pumping stations and dams is similarly affected. This highlights the importance of Government financial assistance towards the capital cost of servicing backlog areas and why appropriate standards should be used, such as those in the *National Handbook on Affordable Water Supply and Sewerage for Small Communities*, ARMCANZ/WSAA, 1999.

- (11) **High pumping cost** (columns 94 to 99 of Table 13 on page 186, Figure 38 on page 74) – is influenced mainly by topography and geography. As noted on page 27, the LWU may be able to achieve significant savings in energy cost.

Similar considerations to those listed in this section apply to sewerage. In addition, a significant cost impactor is whether the LWU is operating nutrient removal facilities at its treatment works or providing filtration and disinfection of its treated sewage effluent.

### 5.3 Trends in Statewide performance indicators for Regional NSW

The trends in **statewide performance** indicators for regional NSW and comparisons with the national median for the 80 utilities reporting in the National Performance Report are shown in Table 4 on page 111. This data provides valuable contextual information to inform your LWU's future water supply and sewerage system planning and the annual review of your LWU's TBL Performance Reports (example Reports on pages 274 to 277). Strategic considerations arising from these results are discussed below.

Interstate performance comparisons for the 2014-15 financial year are provided on pages 17 to 20 of the *2014-15 NSW Water Supply and Sewerage Performance Monitoring Report* ([www.water.nsw.gov.au](http://www.water.nsw.gov.au)) and are not repeated here.

#### Peak day water supplied

**Figure 33c** and Figure 33 on page 111 show that over the past 15 years, the statewide median peak day water supplied per connected property has **declined by 61%** to 1,200 L/property/d, whilst the average annual residential water supplied has reduced by 25%. Although these results have been affected by drought water restrictions during the Millennium Drought of 2001 to 2010 and the very wet years in 2010-11 and 2011-12, they nevertheless point to large reductions in water use, which will enable **avoiding or deferring** the need to augment water treatment and water supply distribution system capacity.

The TBL Performance Report for each LWU shows graphs of the above 2 performance indicators (peak day water supplied (eg. Figure 33c on page 31) and average annual residential water supplied (eg. Figure 33 on page 31)), as well as the peak week water supplied for each of the last 10 years (Figure 33c on page 31). **Utility planning for the design peak day water treatment capacity should be informed by the volumes of your unrestricted peak day and peak week water supplied during hot weather (Figure 33c on page 31), rather than now irrelevant former design values such as 4,000 L/d per tenement.** Refer also to the 20-year planning data set which is now available to each LWU from DPI Water for use in preparing each LWU's IWCM Strategy or Strategic Business Plan (final paragraph of footnote 5 on page 3). Figure 33c on page 111 shows that the statewide median peak day water supplied over the last 6 years has ranged from 1,800 to 1,200 kL/d/connected property.

Further guidance is available in the second set of graphs in Figure 8 on page 45, which shows that for inland utilities such as Dubbo and Orange, the ratio of peak day water supplied to average water supplied is about 250%. For coastal utilities such as Gosford, MidCoast and Port Macquarie Hastings, the ratio is about 150%. Note also that the ratio is higher for coastal utilities with a very high influx of summer holiday population such as Shoalhaven, Eurobodalla and Tweed.

#### Pricing signals

The above also highlights the importance of providing **appropriate pricing signals** to your community including meeting the 75% required outcome for residential revenue from water usage charges (column 3 of Table 5 on page 116, **Figure 16** on page 111), and achieving full cost recovery (column 29 of Table 5). The 75% required outcome applies to LWUs with 4,000 or more connected properties, with a 50% outcome required for smaller LWUs. As noted on page 87 of the *NSW Strategic Business Planning Guidelines* ([www.water.nsw.gov.au](http://www.water.nsw.gov.au)), your long term financial plan needs to take account of your projected capital expenditure over the next 30 years, which is typically well in advance of the need for the new capital investment.

In most cases such strong pricing signals (e.g. the median NSW water usage charge of 226 c/kL – **Figure 12** on page 111) will provide the necessary evidence to confirm significant reductions in the required design peak day demand, with a corresponding avoidance or deferral of the need to augment system capacity and reducing the required future capital expenditure and borrowings. Such avoidance or deferral of system augmentation will be of strategic benefit to your community through reduced future Typical Residential Bills (Figure 14 on page 111). Refer also to the preceding 4 paragraphs and to page 5 of the *2014-15 NSW Water Supply and Sewerage Performance Monitoring Report* ([www.water.nsw.gov.au](http://www.water.nsw.gov.au)).

## 5.4 Action plan

Each LWU is required to prepare and implement a sound annual Action Plan to Council, based on its review of the LWU's TBL Performance Report for its water supply business and for its sewerage business. The Action Plan should address any emerging issues or areas of under-performance and should also document any target dates for remedial actions. It should also report results for the financial year for the key actions set out in the utility's Strategic Business Plan.

The **steps** each LWU should follow **in reviewing its performance and preparing its Action Plan** to Council are shown in the box on page 26 of the *2014-15 NSW Performance Monitoring Report*. In addition to reviewing its TBL Performance Reports to identify any warranted remedial actions, the LWU needs to annually 'roll forward', review and update its 30-year total asset management plan for projects completed, modified or deferred and input the results, together with its latest annual financial statements to prepare and update its 30-year financial plan. The LWU's Action Plan also needs to include actions from the review of its DWMS (page 10), any Section 61 Reports from DPI Water, as well as actions for addressing any 'emerging issues', such as 'liveability', water security and climate variability in its IWCM strategy.

A key role for the Action Plan is to '**close the planning loop**' with the later of the utility's 30-year strategic business plan and 30-year IWCM Strategy and 30-year financial plan. The utility's TRB must therefore be compared with the above projection and any necessary corrective action included in the Action Plan (note 3 on page 29).

In order to assist LWUs, DPI Water will continue to provide a template for each LWU's Action Plan (example on pages 28 and 29) together with the annual TBL reports for each LWU. The template shows your LWU's results, comments and drivers for each indicator and your LWU's ranking relative to similar sized LWUs followed by the ranking relative to all LWUs. Space is provided for you to document your proposed actions (the right hand column on pages 28 and 29).

In order to prepare and implement a sound annual Action Plan to Council, it will be necessary for each LWU to review its performance. In practice this means reviewing whether the performance indicators under 'Health', 'Levels of Service', 'Environmental' and 'Economic' are satisfactory, taking into account factors that may affect performance outlined below. If the indicators are unsatisfactory, the LWU will need to develop suitable options to improve performance.

Guidance for councillors on quickly understanding and using your TBL Performance Report and Action Plan is provided in Appendix G of the *NSW Water and Sewerage Strategic Business Planning Guidelines, July 2011* ([www.water.nsw.gov.au](http://www.water.nsw.gov.au)). This appendix will also assist the water and sewerage manager in preparing a sound Action Plan to Council which addresses the Council's obligations to provide appropriate, affordable, cost-effective and sustainable water supply and sewerage services. An updated copy of this appendix is emailed annually by DPI Water to each LWU with the LWU's TBL Reports and Action Plan templates.

**Table 2 - Median economic efficiency indicators for four sizes of LWUs - Water Supply 2014-15**

| Size of LWU  | Over 10,000<br>connected<br>properties | 3,001 to 10,000<br>connected<br>properties | 1,501 to 3,000<br>connected<br>properties | 200 to 1,500<br>connected<br>properties | Statewide<br>median<br>(page 105) |
|--|--|--|---|---|-----------------------------------|
| Performance indicator                              | (27 LWUs)                              | (28 LWUs)                                  | (19 LWUs)                                 | (22 LWUs)                               | (96 LWUs)                         |
| Operating cost/property (\$)                       | 388                                    | 524  | 555                                       | 634                                     | 400                               |
| Operating cost (c/kL)                              | 130                                    | 115  | 111                                       | 86                                      | 129                               |
| Operating cost/100 km (\$'000)                     | 1,320                                  | 1,240                                      | 1,230                                     | 1,110                                   | 1,320                             |
| Management cost/property (\$)                      | 134                                    | 160  | 139                                       | 135                                     | 141                               |
| Treatment cost <sup>1</sup> /property (\$)         | 45                                     | 123  | 158                                       | 162                                     | 58                                |
| Pumping cost/property (\$)                         | 26                                     | 54   | 95  | 81                                      | 31                                |
| Energy cost <sup>2</sup> /property (\$)            | 17                                     | 38   | 41  | 47                                      | 18                                |
| Water Main cost/property (\$)                      | 74                                     | 82   | 79  | 84                                      | 74                                |
| No. of employees/1,000 properties                  | 1.2                                    | 1.6  | 1.7                                       | 2.1                                     | 1.4                               |
| Economic Real Rate of Return                       | 1.6                                    | 1.0  | 2.8                                       | 0.3                                     | 1.6                               |
| Capital expenditure <sup>3</sup> (\$ per property) | 162                                    | 167  | 258                                       | 87                                      | 155                               |
| Properties served/km of main                       | 40                                     | 28   | 25  | 23                                      | 31                                |

**Notes:**

1. Only LWUs with a water treatment works with at least filtration and disinfection for over 50 per cent of supply have been considered.
2. A component of pumping cost.
3. As a LWU's capital expenditure in any particular year will depend on its overall capital works programming, it is not possible to draw conclusions by comparing your LWU's 2014-15 capital expenditure with the medians in these tables.

**Table 3 - Median economic efficiency indicators for four sizes of LWUs - Sewerage 2014-15**

| Size of LWU  | Over 10,000<br>connected<br>properties | 3,001 to 10,000<br>connected<br>properties | 1,501 to 3,000<br>connected<br>properties | 200 to 1,500<br>connected<br>properties | Statewide<br>median<br>(page 106) |
|--|--|--|---|---|-----------------------------------|
| Performance indicator                              | (24 LWUs)                              | (24 LWUs)                                  | (24 LWUs)                                 | (27 LWUs)                               | (99 LWUs)                         |
| Operating cost/property (\$)                       | 425                                    | 420  | 359                                       | 363                                     | 420                               |
| Operating cost (c/kL)                              | 172                                    | 216  | 205                                       | 187                                     | 193                               |
| Operating cost/100 km (\$'000)                     | 1,720                                  | 1,370                                      | 1,180                                     | 820                                     | 1,720                             |
| Management cost/property (\$)                      | 169                                    | 142  | 122                                       | 98                                      | 160                               |
| Treatment cost/property (\$)                       | 145                                    | 134  | 141                                       | 137                                     | 145                               |
| Pumping cost/property (\$)                         | 72                                     | 43   | 46  | 56                                      | 72                                |
| Energy cost <sup>1</sup> /property (\$)            | 37                                     | 36   | 29  | 25                                      | 37                                |
| Sewer main cost/property (\$)                      | 42                                     | 63   | 32  | 37                                      | 51                                |
| No. of employees/1,000 properties                  | 1.6                                    | 1.7  | 1.5                                       | 2.3                                     | 1.6                               |
| Economic Real Rate of Return                       | 1.7                                    | 2.0  | 1.2                                       | 0.3                                     | 1.7                               |
| Capital expenditure <sup>2</sup> (\$ per property) | 215                                    | 180  | 96  | 69                                      | 204                               |
| Properties served/km of main                       | 43                                     | 36   | 34  | 30                                      | 38                                |

**Notes:**

1. A component of pumping and treatment costs.
2. As a LWU's capital expenditure in any particular year will depend on its overall capital works programming, it is not possible to draw conclusions by comparing your LWU's 2014-15 capital expenditure with the medians in these tables.

### Achieving full cost recovery for water supply

Some NSW utilities have been using a long-term financial model where they input water supply access and usage charges and projected volumes of water supplied to determine the required future revenue. A number of these utilities have experienced significant revenue shortfalls in recent years as a result of reduced water sales due to more efficient water use by residents, above average rainfall and/or drought water restrictions.

Accordingly, it is recommended that utilities do not use models involving access and usage charges in order to avoid such revenue shortfalls as well as potentially misleading customers on the required future access and usage charges. Rather, utilities should use a model such as the NSW Financial Planning Model (FINMOD) – refer to pages 84 and 85 of the *2010-11 NSW Performance Monitoring Report* which determines the required future typical residential bill and annual revenue in current dollars.

Your utility can then set each year's water supply tariff in accordance with Circular LWU 11 of March 2011 using an evidence based estimate of the residential water to be supplied in the next financial year, together with the access and usage charges required to yield the Typical Residential Bill and annual revenue in accordance with your 30-year financial plan.

Such an approach is transparent as the financial modelling discloses the required Typical Residential Bill (and annual revenue) in current dollars as required by Items 1 and 16 of the Strategic Business Planning Check List, July 2014 ([www.water.nsw.gov.au](http://www.water.nsw.gov.au)).

In addition, annually setting your water supply tariff in accordance with Circular LWU 11 will minimise the risk of revenue shortfalls while maintaining Typical Residential Bills in accordance with your LWU's financial plan. Assistance is available from DPI Water ([urbanwater.ctw@dpi.nsw.gov.au](mailto:urbanwater.ctw@dpi.nsw.gov.au) or (02) 9842 8508).

Each LWU which meets all the outcomes required by the *NSW Best-Practice Management Framework* (page 6), including a current 30-year IWCM Strategy and financial plan, is encouraged to pay a dividend from the surplus of its water and sewerage businesses to the council's general revenue. A LWU which pays such an 'efficiency dividend' will be moving towards **upper bound pricing**, which is required under the National Water Initiative, where practicable.

Refer also to:

- section 4.4 on page 13, which notes that the NSW Government and the Productivity Commission encourage all LWUs to use a 2-part tariff with a uniform water usage charge per kL for all water use and highlights the strategic benefits of the strong NSW pricing signals; and
- note 3 on page 29, which indicates that comparing your Typical Residential Bill (TRB) with the projection in the later of your IWCM Strategy and Financial Plan and your Strategic Business Plan is mandatory in preparing your annual Action Plan to Council. If you are not achieving full cost recovery, you will need to review & increase your access and/or usage charges in order to do so.

### Implementation of best-practice management framework

Implementation of each of the key outcomes (Table 3 on page 108) required by the BPM Framework is shown on the TBL Report (page 30) and the overall level of implementation is shown in column 33 of Table 5 on page 116. LWUs should address any areas not yet implemented, which are shown on the Action Plan template (page 28). For each instance of non-implementation, the Action Plan should briefly outline the strategy and target date for achieving implementation. LWUs that achieve the outcomes required by the Framework will have appropriate, affordable, cost-effective and sustainable piped water supply and sewerage services and will comply with the National Water Initiative. As noted on page 5 implementation of the 19 outcomes required by the Framework is also a prerequisite for payment of a dividend from the surplus of the LWU's water supply or sewerage business and for financial assistance towards the capital cost of backlog infrastructure (as at 1996) under the *NSW Government's Country Towns Water Supply and Sewerage Program* ([www.water.nsw.gov.au](http://www.water.nsw.gov.au)) or the Regional Water and Waste Water Backlog Program ([www.water.nsw.gov.au](http://www.water.nsw.gov.au)). Refer also to footnote 6 on page 7.

### Performance based on triple bottom line

LWUs should review the Performance indicators shown in the TBL Report (example on page 30) and investigate those indicators where performance is below the median. In particular, for those indicators with a ranking of 4 or 5, LWUs should investigate the reasons for the ranking and if appropriate, develop a strategy for improvement. It should be noted that a low ranking does not necessarily imply poor performance as there are a number of factors that can impact performance as shown in section 5.2 on page 17.

Eg., the rankings take no account of the impact of utility characteristics (e.g. whether the water supply is fully filtered or whether it is a nearby good quality groundwater, whether the LWU provides a bulk storage dam & raw water transfer mains and channels etc.). The Action Plan should take account of these characteristics.

As noted above, the rankings are based on statewide medians. While all LWUs should strive to raise their performance to at least the statewide 80th percentile (Tables 1, 2 and 2A on pages 105, 106 and 107), it is also useful to compare your LWU's performance with LWUs of a similar size. To assist LWUs in such comparisons, the medians for the relevant indicators have been shown in Tables 5 to 18 for each LWU size grouping. In addition, LWUs may benchmark their performance against LWUs with similar characteristics (section 3.3 on page 4).

Further factors that may assist LWUs in their assessment of performance are listed below.

### Utility characteristics

- **Renewals** – LWUs should ensure that their TRB in current dollars (i.e. adjusted for inflation) is consistent with the projection in its 30-year financial plan in order to ensure it is raising sufficient revenue for the required infrastructure. LWUs should also examine their asset management plan and ensure that the necessary funds are directed to maintenance and renewals. Refer to section 4.5 on page 14.
- **Employees** – the number of employees per 1,000 properties is a good indicator of operating and management costs (column 32 of Table 9 on page 169, Figure 10 on page 48, column 14 of Table 14 on page 189, Figure 41 on page 78). If the number of employees per 1,000 properties is significantly higher than the median shown in the tables on page 21 for the size of LWU, you should examine the management structure and identify the reasons for the difference and provide a brief explanation or your proposed remedial action in the Action Plan. However, it is important to note that a higher number of employees per 1,000 properties is needed for **small non-contiguous water supply systems** and for **small water or sewage treatment works** (refer to the first dot point on page 27 and to page 21).
- **Employee awareness and training** is of strategic importance in the safe and effective delivery of water supply and sewerage services, eg. refer to Element 7 of the *NSW guidelines for drinking water management systems*, NSW Health and NSW Office of Water, 2013 ([www.health.nsw.gov.au/environment/water](http://www.health.nsw.gov.au/environment/water)). In particular, LWUs need to ensure that water treatment operators, wastewater treatment operators, dam safety officers, trade waste officers and engineers update their training and skills at least every 3 years. Refer to the boxes on pages 9 and 36. LWUs should provide an average of at least 2 days/a of appropriate training for each employee. Refer to Tables 9 and 14 on pages 169 and 189 for the training currently provided by each LWU.
- **Properties served per km** – the density of urban development has a large effect on the infrastructure cost. For LWUs with >10,000 properties the median is 35 properties per km (range 6 to 73), while for LWUs with 200 to 1,500 properties the median is 22 (range 3 to 34) (column 26 of Table 9 on page 169, Figure 6 on page 43, column 9 of Table 14 on page 189, Figure 40 on page 77).

### Social factors

- **Typical residential bill (TRB)** – as noted on page 17, this is the principal indicator of the overall cost of a water supply or sewerage system (it is the annual bill paid by a residential customer using the utility's average annual residential water supplied). A critical element of the TRB is the operating cost (OMA – operation, maintenance and administration) (columns 31 and 32 of Table 5 on page 116, column 67 of Table 11 on page 180, Figures 33, 34, 35 on pages 70, 71, 72) as noted on page 27 under Economic Factors – Efficiency. As noted on page 20, your LWU's Action Plan must report on whether the TRB is consistent with the projection in the later of your LWU's 30-year strategic business plan and 30-year IWCM Strategy and financial plan and on any warranted corrective action. A TRB

which meets these required outcomes will also ensure you are achieving **full cost recovery** (ERRR on page 26).

- **Residential revenue from usage charges (per cent)** – The *Best-Practice Management Framework* (page 6) requires LWUs with 4,000 or more properties to have at least 75 per cent of residential revenue generated through usage charges, while LWUs with fewer properties, including LWUs with a dual supply must have at least 50 per cent of residential revenue generated through usage charges. This is a key demand management measure to ensure customers receive a sufficiently **high pricing signal** to encourage careful water use (column 3 of Table 5 on page 116, column 13 of Table 6 on page 134, Figure 13 on page 51). As noted in Section 4.4 on page 13, the statewide median residential revenue from water usage charges was 72 per cent. Refer also to item 9 on page 18 and the residential water usage charge below.
- **Residential water usage charge (c/kL)** – Higher usage charges have been ranked ‘1’ because they provide a strong pricing signal, while lower charges have been ranked ‘5’. However, this indicator should be viewed in conjunction with the TRB and whether the LWU is achieving full cost recovery, in which case a lower water usage charge may be a good result. The **strategic benefits of the strong NSW pricing signals** and the resulting efficient water use are highlighted on page 5 of the *2014-15 NSW Water Supply and Sewerage Performance Monitoring Report*. Refer also to Figure 12 on page 50, Figure 12 on page 111 and column 5b of Table 6 on page 134.

## Health

- **Microbiological water quality compliance** – This is the most important public health indicator, achievement of microbiological compliance is a high priority for each LWU and must be reported in the annual Action Plan to Council. As shown in Figure 17 on page 55, all the LWUs complied with the microbiological water quality requirements in 2014-15 (also refer to columns 9 and 10 of Table 5 on page 116). LWUs with less than 98 per cent of samples containing no *E. coli* do not comply with the *Australian Drinking Water Guidelines, 2011*. Microbiological non-compliance, boil water alerts, the remedial action implemented and whether it was successful must be reported in your LWU's annual Action Plan to Council (refer to pages 8 to 12, note 4 on page 29 and Appendix E on page 305). Assistance is available from your DPI Water Regional Water and Sewerage Treatment Officer (refer to page 36 for the contact details of each officer).

As indicated in section 4.3 on pages 9 and 10, each LWU has prepared a risk-based drinking water management system (DWMS) and now needs to review the effectiveness of its DWMS and the LWU's implementation of the DWMS, at least annually, to ensure that it maintains currency with the drinking water supply. A record of this review should be kept and any required corrective action documented. Assistance is available from DPI Water ([urbanwater.ctw@dpi.nsw.gov.au](mailto:urbanwater.ctw@dpi.nsw.gov.au) or (02) 9842 8508).

- **Public health incidents** – Where this indicator is significantly higher than the statewide median, your LWU's Action Plan should provide a brief explanation and the proposed remedial action if appropriate.
- **Capital investment on improving public health** – If a LWU reported zero for this indicator, investigate to ensure that this indicator is not under reported.
- **Sewerage coverage** – Figure 46 on page 83 – percentage of the urban population (residential zoned land) with a reticulated sewerage service. Refer also to Indicator 16 on page 276.

## Customer service

- **Water quality complaints** – LWUs with a high number of complaints (in the bottom 20 per cent of LWUs) should investigate the reasons for the complaints, including past performance & trends indicated in page two of the TBL Report. Provide a brief explanation together with proposed remedial action in your LWU's Action Plan. Note that the result for this indicator will be influenced by the type of business (e.g. Unfiltered supply, groundwater etc) (column 13 of Table 5 on page 116, Figure 19 on page 57).
- **Odour complaints** – This is a critical indicator for providing appropriate sewerage levels of service. LWUs with a high number of complaints (in the bottom 20 per cent of LWUs) should investigate the reasons for the complaints; including past performance and trends indicated in page two of the TBL Report. Provide a brief explanation together with proposed remedial action in your LWU's Action Plan (column 61 of Table 17 on page 198, Figure 49 on page 86).
- **Number of main breaks** – LWUs should annually monitor their breaks/100km of main, paying close attention to any sections of main with a high incidence of breaks (say treble the statewide median of

9 breaks per 100 km). LWUs with a high incidence of breaks should investigate the likely reasons for the breaks, including the past performance and trends indicated in page two of the TBL Report. Provide a brief explanation together with proposed remedial action in your LWU's Action Plan (column 15 of Table 5 on page 116, Figure 21 on page 59). Refer also to section 4.5 on page 14.

- **Average duration of unplanned interruptions (water)** – where this indicator is significantly higher than the statewide median, your LWU's Action Plan should provide a brief explanation together with proposed remedial action if appropriate (column 14 of Table 5 on page 116).
- **Average interruption (sewerage)** – where this indicator is significantly higher than the statewide median of 95 minutes, your LWU's Action Plan should provide a brief explanation together with proposed remedial action if appropriate (column 65 of Table 17 on page 198).

### Environmental factors

- **Average annual residential water supplied** – This indicator is heavily influenced by the location and type of LWU (e.g. an inland LWU would expect to have high residential water supplied while a LWU with a dual supply would expect to have a very high value) and any applied water restrictions. Inland LWUs have significantly higher residential water supplied due to their hotter and drier climate and the use of evaporative coolers. Note that the median residential water supplied for inland LWUs in 2014-15 was 225 kL/property compared to 150 kL/property for coastal LWUs (column 17 of Table 5 on page 116, column 14 of Table 6 on page 134, Figure 26 on page 64). Refer also to Item 9 on page 18.
- **Total urban water supplied** – Figure 9 on page 47 and column 2 of Table 5 on page 116.
- **Real Losses** – LWUs should monitor their Real Losses (column 18 of Table 5 on page 116, column 41 of Table 10 on page 172, Figure 28 on page 66) in L/d/connection. These should be minimised if the LWU is facing drought water restrictions or the need for augmenting the capacity of its water supply headworks system or its water treatment works. Such timely reduction of Real Losses will provide major economic benefits through deferral of the need for capital investment for upgrading of infrastructure. As noted on page 16, for almost all LWUs, monitoring your leakage in "L/d per connection" is the relevant measure for tracking your LWU's leakage performance. As also noted on page 16, **non-revenue water (NRW)** should also be monitored in L/d/connection (column 41f of Table 10 on page 172, Figure 29 on page 67).
- **Water Losses (ILI)** – The real losses above are the principal indicators of leakage performance. The ILI may provide some additional information and is recommended for international comparisons (page 15; refer also to footnote 18 on page 16). ILI values of less than about 1.5 indicate excellent management of real losses, while an ILI close to 1.0 means that the real losses are close to the unavoidable or technical minimum losses. An ILI of less than 1.0 is meaningless and may indicate errors in the input data. An ILI greater than three may indicate old or poor infrastructure or a relatively relaxed active leakage control policy (column 41b of Table 10 on page 172).
- **Recycled water** – The volume of recycled water use includes effluent reuse for town water and agricultural uses. The volume reported for town water should equal the recycled volume shown in the water supply report. In 2014-15 20 per cent of LWUs reused over 50 per cent of their effluent (columns 13 to 14b of Table 8 on page 155 and Figure 57 on page 94). As shown in columns 21 and 22 of Table 5 on page 116, the highest volume recycled by a utility was 5,600 ML and a further five utilities each recycled over 2,000 ML. Refer also to figure 33d on page 111, figures 27 and 26a on page 114 and figure 27 on page 277.
- **Compliance with BOD in licence** – where compliance is low (e.g. below 90 per cent), provide a brief explanation together with proposed remedial action in the Action Plan (column 55 of Table 17 on page 198, Figure 50 on page 87).
- **Compliance with SS in licence** – where compliance is low (e.g. in the bottom 20 per cent of LWUs), provide a brief explanation together with proposed remedial action in the Action Plan if appropriate (column 57 of Table 17 on page 198, Figure 51 on page 88).
- **Percent of sewage treated that was compliant** – Figure 54 on page 91 and column 19 of Table 5 on page 116. Refer also to figure 18 on page 113 and figure 18 on page 277.
- **Sewer main breaks and chokes** – sections of sewer main with a high incidence of breaks and chokes (say treble the statewide median of 35 per 1,000 connected properties) warrant close attention. Provide a brief explanation together with proposed remedial action in the Action Plan

(column 20 of Table 5 on page 116, column 59 of Table 17 on page 198, Figure 55 on page 92). Refer also to figure 36 on page 113 and figure 36 on page 277

- **Sewer overflows to the environment** – where this indicator is significantly higher than the statewide median, provide a brief explanation together with proposed remedial action in the Action Plan (column 60 of Table 17 on page 198, Figure 56 on page 93).
- **Environmental incidents** – where this indicator is significantly higher than the statewide median, provide a brief explanation together with proposed remedial action in the Action Plan.

## Economic factors

### Financial

- **Economic real rate of return (ERRR)** – this reflects the rate of return generated from operating activities (i.e. excluding interest income, grants for acquisition of assets and gain/loss on disposal of assets). Water and sewerage charges should be sufficiently high to ensure continuing financial viability and provide for asset renewals and a positive rate of return, but not so high that they generate excessive monopoly profits. The ERRR is a good indicator of the financial health of a business (columns 27 and 28 of Table 5 on page 116, column 12 of Table 6 on page 134, Figure 32 on page 69, column 11 of Table 7 on page 146, Figure 61 on page 97). LWUs should achieve **full cost recovery** by setting each year's tariff to raise the required revenue on the basis of its careful estimate of the water to be supplied in the next financial year as indicated in the box on page 22, which will result in a satisfactory Typical Residential Bill (TRB – page 23). This is particularly important during drought periods. Refer also to Figures 27 and 28 on pages 59 and 60 of the *2014-15 NSW Performance Monitoring Report* and Appendix G on page 84 of the *2010-11 NSW Performance Monitoring Report*.
- **Return on assets** – this ratio is similar to the ERRR. It indicates the earnings generated before interest and tax (EBIT) for the assets controlled by the business. It is calculated as the operating profit before dividends divided by the difference between total assets and total liabilities. All LWUs should aim to achieve a positive value for ERRR or for return on assets (column 11 of Table 6 on page 134, column 9 of Table 7 on page 146, column 24c of Table 5A on page 120). Refer also to note 3 on page 29.
- **Net Debt to equity**<sup>20</sup> – net debt is the sum of long and short term borrowings less cash and investments. Equity is the total assets less total liabilities. In 2014-15 the NSW median net debt to equity for water supply and sewerage was -1% (column 19a of Table 5 on page 116). LWUs facing significant capital investment are encouraged to make greater use of borrowings to reduce their required TRB. **Twenty year loan terms are strongly recommended** in order to avoid an unfair financial burden on existing customers and to facilitate **inter-generational equity**. Refer also to Item 10 on page 19.
- **Loan payment (\$/property)** – this indicator shows the component of the TRB applied to meet debt payments. A high loan payment per property indicates a relatively high capital cost per property, recent construction of significant capital works or use of short-term loans (column 66a of Table 11 on page 180 and column 51a of Table 16 on page 195). The median loan payment in 2014-15 for water supply was \$69 per connected property (Table 1 on page 105).
- **Interest cover** – this ratio is an indicator of the LWU's ability to meet interest commitments. It is calculated as the earnings before interest and tax (EBIT) divided by net interest (interest expense less interest income). The interest cover is nil for a loss making business (column 27 of Table 5A on page 120). As a general guide, an interest cover >2 is a good interest cover position. For 2014-15, the median interest cover for water supply and sewerage was 4 (Table 2A on page 107).

<sup>20</sup> It is important to note that most NSW LWUs have relatively little borrowings at present. In **2014-15** the statewide median net debt to equity for LWU water and sewerage was -1% (range -37% to 22%). The **2014-15** net debt to equity for major Australian utilities include 98% for Sydney Water, 134% for ICON Water, 168% for Melbourne Water, 56% for Yarra Valley Water, 63% for Queensland Urban Utilities, 53% for Water Corporation (WA), 120% for SA Water and 81% for Hunter Water (National Performance Report 2014-15 for Urban Water Utilities). Refer also to graph 27 on page 211. Providing your utility has a soundly based asset management plan and financial plan (including sensitivity analysis), net debt to equity of up to 50% when financing a major capital works program for growth and/or improved levels of service, would be satisfactory for NSW LWUs.

## Efficiency

The operating cost (OMA – operation, maintenance and administration) per property is a prime indicator of the performance of an LWU and should be reviewed carefully by each LWU to ensure it has an efficient operating cost (columns 31 and 32 of Table 5 on page 116, column 67 of Table 11 on page 180, Figure 33 on page 70). The components of operating cost (shown on pages 21, 31, 112, 114, 275 and 277) are:

- **Management cost** – this includes administration, engineering and supervision and is typically almost 40 per cent of the total operating cost (column 68a of Table 11 on page 180, Figure 36 on page 73). The number of employees per 1,000 properties can be a good indicator of the operating and management costs and hence the efficiency of an LWU. However, LWUs with a number of non-contiguous (i.e. separate) water supply systems and those with small water treatment works or small sewage treatment works will need a higher level of employees/1000 properties in order to effectively manage their systems (refer also to ‘employees’ on page 23 and page 21). Similarly, LWUs with a low development density, under about 20 properties served / km of water main (column 26 of Table 9 on page 169) will need a higher level of employees.
- **Treatment cost (water)** – (columns 104 to 107 of Table 13 on page 186, Figure 37 on page 74) this is dependent on the type and quality of the water source and the extent of treatment provided. In addition, as shown in the Table on page 21, there are great economies of scale for the operation of water treatment works (i.e. facilities involving at least filtration and disinfection).
- **Treatment cost (sewage)** – (columns 89 to 92 of Table 18 on page 201, Figure 66 on page 102) this is dependent on the type of treatment and the discharge requirements. Where the discharge licence conditions are stringent, involving for example a low level of phosphorus, treatment costs will be high.
- **Pumping cost (water)** – (columns 94 to 98 of Table 13 on page 186, Figure 38 on page 75) this is dependent on topography and, for water supply, the location of the water source. For example, Essential Energy has a high pumping cost due to the distance required to pump from the water source, while Fish River is almost a fully gravitational supply, with negligible pumping costs. For water supply, there are significant economies of scale in pumping cost per property.
- **Energy cost** – (column 98 of Table 13 on page 186) this is mainly a consequence of pumping requirements and is a component of pumping cost for water supply. Energy cost may be reduced by maximising pumping in off peak periods or by obtaining a competitive energy rate from the energy supplier (e.g. maximising off peak pumping has provided annual savings in energy costs of over \$200,000 for a number of large water supplies). For sewerage, energy cost is a component of pumping and treatment costs (column 83 of Table 18 on page 201). Significant cost savings may be available by optimising energy use in the treatment process (e.g. such optimising of energy use has provided annual savings of over \$100,000 for a number of large sewage treatment works).
- **Water and Sewerage mains cost** – (column 84 of Table 13 on page 186, Figure 39 on page 76, column 70 of Table 18 on page 201, Figure 68 on page 104) this is dependent on the age and condition of the mains, the ground conditions and the number of connected properties per km of main.

## 5.5 Example TBL report and action plan – Coffs Harbour City Council

### Coffs Harbour City Council Water Supply – Action Plan Page 1

#### Summary

In 2014-15, Coffs Harbour City Council has implemented all 19 planning, pricing and management outcomes (10 water, 9 sewerage) required by the *NSW Best-Practice Management (BPM) Framework* and its performance has continued to be very good.

The key actions required are shown below for Indicators 20 and 32. Note also Indicators 12 and 14 and that a new IWCM Strategy and financial plan are required in 2016.

Key action from Council's Strategic Business Plan:

- Strategic business plan and financial plan completed in May 2012

(<http://www.coffsharbour.nsw.gov.au/places-for-living/Documents/Strategic-Business-Plans-Water-Supply-Sewerage.pdf>).

| INDICATOR               |   | RESULT <sup>2</sup>                                     |                    | COMMENT/DRIVERS   | ACTION  |
|-------------------------|---|---|--------------------|---|---|
|                         | <b>Best-Practice Management (BPM) Framework</b> | Implemented all the Best-Practice Outcomes <sup>1</sup> | Very good          | Implementation of the required BPM outcomes demonstrates effectiveness and sustainability of water supply business. 100% implementation is required for eligibility to pay an 'efficiency dividend'.                        | Prepare a new 30-year IWCM Strategy, Financial Plan and Report in accordance with the July 2014 IWCM Check List ( <a href="http://www.water.nsw.gov.au">www.water.nsw.gov.au</a> ) as the existing IWCM Strategy is over 6 years old. |
| <b>CHARACTERISTICS</b>  |   |   |                    |   |   |
| 5                       | Connected property density                      | 40 per km of main<br>High ranking (2, 1)                |                    | A connected property density below 30 can significantly increase the cost per property of providing services, as will also a high number of small discrete water supply schemes.  |   |
| 9                       | Renewals expenditure                            | 0%<br>Lowest ranking (5, 5)                             | May require review | Adequate funds must be programmed for works outlined in the Asset Management Plan – page 3 of the 2014-15 NSW Performance Monitoring Report.  | Satisfactory. Appropriate renewals included in capital works program reported in Council's Strategic Business Plan 2012.  |
| 10                      | Employees                                       | 1.9 per 1,000 props<br>Low ranking (4, 3)               | May require review |   | Satisfactory in view of Council's storage dams and water treatment works.   |
| <b>SOCIAL - CHARGES</b> |   |   |                    |   |   |
| 12                      | Residential water usage charge                  | 267 c/kL<br>High ranking (2, 1)                         | Good               | Benefits of strong pricing signals are shown on page 5 of the 2014-15 NSW Performance Monitoring Report.  | Good. Consider replacing the existing inclining block tariff with a two-part tariff [refer to Circular LWU11] with a uniform usage charge for all water use, as recommended by the NSW Government and the Productivity Commission.    |
| 13                      | Residential access charges                      | \$143 per assessment<br>Highest ranking (1, 1)          | Good               |   | See 12.   |
| 14                      | Typical residential bill <sup>2</sup> (TRB)     | \$588 per assessment<br>Median ranking (3, 2)           | Good               | TRB should be consistent with projection in the financial plan. Drivers – OMA Management Cost and Capital Expenditure.  | The TRB of \$588 is satisfactory as it is greater than the projected TRB of \$585 (2015/16\$) in Council's SBP. The 2016-17 tariff will be determined in accordance with Circular LWU11 of March 2011.                                |
| 15                      | Typical developer charges                       | \$10100 per ET<br>Highest ranking (1, 1)                | Good               |   |   |
| 16                      | Residential revenue from usage charges          | 76% of residential<br>Highest ranking (1, 1)            | Very good          | ≥ 75% of residential revenue should be generated through usage charges.   | See 12.   |
| <b>SOCIAL – HEALTH</b>  |   |   |                    |   |   |
| 19                      | Physical quality compliance                     | Yes<br>Highest ranking (1, 1)                           | Very good          |   |   |
| 19a                     | Chemical quality compliance                     | Yes<br>Highest ranking (1, 1)                           | Very good          |   |   |
| 20                      | Microbiological compliance <sup>4</sup>         | Yes<br>Highest ranking (1, 1)                           | Very good          | Critical indicator. LWUs should annually review their risk based Drinking Water Management System (DWMS) in accordance with NSW Guidelines for drinking water management systems, NSW Health and NSW Office of Water, 2013. | Also address the requirements of Circular LWU 18 of June 2014 and any Section 61 Reports from DPI Water. Include the corrective actions identified in your Action Plan.   |

1. Council needs to annually 'roll forward', review and update its 30-year total asset management plan (TAMP) and 30-year financial plan, review Council's TBL Performance Report and prepare an **Action Plan** to Council. The Action Plan is to include any actions identified in Council's annual review of its DWMS (Indicator 20) and any Section 61 Reports from DPI Water. Refer to pages 25, 26, 103 and 108 of the 2014-15 NSW Water Supply and Sewerage Performance Monitoring Report.

2. The ranking relative to similar size LWUs is shown first (Col. 2 of TBL Report) followed by the ranking relative to all LWUs (Col. 3 of TBL Report).

## Coffs Harbour City Council Water Supply – Action Plan Page 2

| INDICATOR                  |   | RESULT  |                    | COMMENT/DRIVERS  | ACTION  |
|----------------------------|---|---|--------------------|--|---|
| SOCIAL – LEVELS OF SERVICE |   |   |                    |  |   |
| 25                         | Water quality complaints                  | 0 per 1,000 props<br>Highest ranking (1, 1)   | Very good          | Critical indicator of customer service. Can be influenced by the type of business - e.g. unfiltered supply.  |   |
| 26                         | Service complaints                        | 0.1 per 1,000 props<br>Highest ranking (1, 1) | Very good          | Key indicator of customer service.   | Council's reporting system has been revised to record complaints only, [ie. expressions of dissatisfaction], in accordance with the definition of this indicator. |
| 27                         | Incidence of unplanned interruptions      | 11 per 1,000 props<br>High ranking (2, 2)     | Good               | Key indicator of customer service, condition of network and effectiveness of operation.  |   |
| 30                         | Number of main breaks                     | 3 per 100km of main<br>Highest ranking (1, 1) | Very good          | Drivers – condition and age of water mains, ground conditions.   | Good, as result is well below the Statewide Median of 9 breaks per 100 km of main.  |
| 32                         | Total Days Lost                           | 3.2%<br>Median ranking (3, 4)                 | Satisfactory       |  | Will be reviewed.   |
| ENVIRONMENTAL              |   |   |                    |  |   |
| 33                         | Average annual residential water supplied | 167 kL per prop<br>Median ranking (3, 2)      |                    | Drivers – available water supply, climate, location (Inland or coastal), pricing signals (Indicator 12), restrictions.   |   |
| 34                         | Real losses (leakage)                     | 50 L/c/d<br>High ranking (2, 2)               | Good               | Loss reduction is important where an LWU is facing drought water restrictions or the need to augment its water supply system.  |   |
| ECONOMIC                   |   |   |                    |  |   |
| 43                         | Economic Real Rate of Return (ERRR)       | 2%<br>Highest ranking (1, 2)                  | Good               | Reflects the rate of return generated from operating activities (excluding interest income and grants). An ERRR or ROA of ≥ 0% is required for full cost recovery.                         | Satisfactory. See 14.   |
| 44                         | Return on assets (ROA)                    | 0.6%<br>Low ranking (4, 4)                    |                    | See 43.  |   |
| 45                         | Net debt to equity – water and sewerage   | 13%<br>Highest ranking (1, 1)                 | Very good          | LWUs facing significant capital investment are encouraged to make greater use of borrowings – page 13 of the 2014-15 NSW Performance Monitoring Report.                                    |   |
| 46                         | Interest cover                            | 1<br>Median ranking (3, 3)                    | Satisfactory       | Drivers – in general, an interest cover > 2 is satisfactory.   |   |
| 47                         | Loan payment                              | \$454 per prop<br>Highest ranking (1, 1)      | Very good          | The component of TRB required to meet debt payments. Drivers – expenditure on capital works, short term loans.   |   |
| 49                         | Operating cost (OMA)                      | \$395 per prop<br>High ranking (2, 1)         | Good               | Prime indicator of the financial performance of an LWU. Drivers – development density, level of treatment, management cost, topography, number of discrete schemes and economies of scale. | The components below have been carefully reviewed as part of developing Council's strategic business plan.  |
| 51                         | Management cost                           | \$153 per prop<br>Low ranking (4, 3)          | May require review | Typically about 40% of the OMA. Drivers – No. of employees. No. of small discrete water schemes.   |   |
| 52                         | Treatment cost                            | \$76 per prop<br>Low ranking (4, 2)           | May require review | Drivers – type and quality of water source. Size of treatment works  | Satisfactory, as Council has a dissolved air flotation water treatment works.   |
| 53                         | Pumping cost                              | \$13 per prop<br>High ranking (2, 1)          | Good               | Drivers – topography, development density and location of water source.  |   |
| 55                         | Water main cost                           | \$93 per prop<br>Low ranking (4, 4)           | May require review | Drivers – age and condition of mains. Ground conditions. Development density.  |   |
| 56                         | Capital expenditure                       | \$53 per prop                                 |                    | An indicator of the level of investment in the business.   |   |
|                            |   | Lowest ranking (5, 5)                         |                    | Drivers – age and condition of assets, asset life cycle and water source.  |   |

3. Review and comparison of the 2015-16 **Typical Residential Bill (Indicator 14)** with the projection in the later of your IWCN Strategy and financial plan and your Strategic Business Plan is **mandatory**. Refer to page 104 of the 2014-15 NSW Performance Monitoring Report.  
In addition, if both indicators 43 and 44 are negative, you must report your proposed 2016-17 typical residential bill to achieve full cost recovery.

4. **Microbiological compliance (Indicator 20)** is a **high priority** for each NSW LWU. Corrective action for non-compliance ( $\leq 97\%$ ), or any 'boil water alerts' must be reported in your Action Plan. Refer to pages 7, 8 and 26 of the 2014-15 NSW Water Supply and Sewerage Performance Monitoring Report ([www.water.nsw.gov.au](http://www.water.nsw.gov.au)).

Coffs Harbour City Council Water Supply TBL Report (Page 1)

Coffs Harbour City CouncilTBL Water Supply Performance2014-15

WATER SUPPLY SYSTEM - Coffs Harbour City Council serves a population of 71,300 (25,060 connected properties). Water is sourced from the Nymboida River (part of the Regional Water Supply which includes Shannon Creek Dam) and also from the Orara River. Water is transferred to Karangi Dam where it is treated and supplied to the Coffs Harbour area which stretches from Sawtell to Corindi. Council has 2 storage dams at Karangi and Woolgoolga (total storage capacity 5,870ML), not including the 30,000ML Shannon Creek Dam. Council has 2 smaller systems providing treated water to Coramba and Nana Glen villages. The water supply network comprises a dissolved air flotation treatment works, a conventional water treatment works and a chlorinator, 18 service reservoirs (88 ML), 7 pumping stations, 43 ML/d delivery capacity into the distribution system, 157 km of transfer and trunk mains and 478 km of reticulation. 95% of water supplied is potable and 5% nonpotable (recycled).

PERFORMANCE - Coffs Harbour City Council achieved 100% implementation of the outcomes required by the NSW BPM Framework. The 2015-16 typical residential bill was \$588 which was close to the statewide median of \$593 (Indicator 14). The economic real rate of return was similar to the statewide median (indicator 43). The operating cost (OMA) per property was \$395 which was close to the statewide median of \$400 (Indicator 49). Water quality complaints were negligible compared to the statewide median of 3 (Indicator 25). Compliance was achieved for microbiological water quality (100% of the population, 3 of 3 zones compliant), chemical water quality and physical water quality. There were no failures of the chlorination system or the treatment system. Coffs Harbour City Council reported no water supply public health incidents. Current replacement cost of system assets was \$423M (\$15,900 per assessment). Cash and investments were \$29.4M, debt was \$77M and revenue was \$22M (excluding capital works grants).

IMPLEMENTATION OF OUTCOMES REQUIRED BY THE NSW BEST-PRACTICE MANAGEMENT (BPM) FRAMEWORK

|  |                   |  |      |
|--|-------------------|--|------|
| (1) Complete Current Strategic Business Plan & Financial Plan              | YES <sup>12</sup> | (3) Sound water conservation implemented             | YES  |
| (2) (2a) Pricing - Full Cost Recovery, without significant cross subsidies | Yes               | (4) Sound drought management implemented             | YES  |
| (2b,2c) Pricing - Appropriate Residential Charges                          | Yes               | (5) Complete performance reporting (by 15 September) | YES  |
| (2d) Pricing - Appropriate Non-residential Charges                         | Yes               | (6) Integrated water cycle management strategy       | YESC |
| (2e) Pricing - DSP with Commercial Developer Charges                       | Yes               | IMPLEMENTATION OF ALL OUTCOMES                       | 100% |

|               |                             |      | Pumping cost (\$/prop)   | \$/prop   | 13                           |                    |  |           |  |
|               |                             |      | Energy cost (\$/prop)  | \$/prop   | 9                            |                    |  |           |  |
|               |                             |      | Water main cost (\$/prop)  | \$/prop   | 93                           |                    |  |           |  |
|               |                             | F28  | Capital Expenditure (\$/prop)  | \$/prop   | 53                           |                    |  |           |  |

- NOTES :
- Col 2 rankings are on a % of LWUs basis - best reveals performance compared to similar sized LWUs (ie. Col 1 is compared with LWUs with >10,000 properties).
  - Col 3 rankings are on a % of LWUs basis - best reveals performance compared to all LWUs (ie. Col 1 is compared with all LWUs).
  - Col 4 (Statewide Median) is on a % of connected properties basis- best reveals statewide performance (gives due weight to larger LWUs & reduces effect of smaller LWUs).
  - Col 5 (National Median) is the median value for the 76 utilities reporting water supply performance in the National Performance Report 2014-15 ([www.bom.gov.au](http://www.bom.gov.au)).
  - LWUs are required to annually review key projections & actions in the later of their IWCM Strategy and financial plan and their Strategic Business Plan and to annually 'roll forward', review and update their 30-year total asset management plan (TAMP) and 30-year financial plan.
  - 2015-16 Non-residential Tariff: Access Charge based on Meter Size: 40mm \$572, Two Part Tariff: Usage Charge 267c/kL.
  - Non-residential water supplied was 25% of potable water supplied excluding non-revenue water.
  - Non-residential revenue was 24% of annual rates and charges, indicating fair pricing of services between the residential and non-residential sectors.
  - The operating cost (OMA) per property was \$395. Components were: management (\$153), operation (\$108), maintenance (\$104), energy (\$9) & chemical (\$17).
  - Rehabilitations included 0.3% of water mains, 0.14% of service connections and 5.8% of water meters. Renewals expenditure was \$12,000/100km of main.
  - Compliance with ADWG 2011 for drinking water quality is shown as "Yes" if compliance has been achieved (indicators 19, 19a & 20).
  - Coffs Harbour City Council has 3 fully qualified water treatment operators who meet the requirements of the National Certification Framework.
  - As Council's IWCM Strategy is over 6 years old, it will need to prepare a new 30-year IWCM Strategy, financial plan and report in accordance with the July 2014 IWCM Check List ([www.water.nsw.gov.au](http://www.water.nsw.gov.au)).

## 6 GENERAL NOTES

This *2014-15 NSW Water Supply and Sewerage Benchmarking Report* provides the full suite of performance indicators and benchmarking data to enable each LWU to improve its productivity and performance through benchmarking its performance against that of similar LWUs. The benchmarking report is available on the DPI Water website ([www.water.nsw.gov.au](http://www.water.nsw.gov.au)).

- (1) **Triple bottom line (TBL) focus** – to provide a balanced view of the long-term sustainability of NSW LWUs, a triple bottom line accounting focus has been adopted, with performance reported on the basis of **social, environmental** and **economic** performance indicators.
- (2) **Data validation** – independent auditing and data validation (Appendix H on page 351) assure data reliability for the NSW Performance Monitoring System. The data validation procedures include matters such as:
  - Aggregated businesses (section H4.1 on page 353)
  - Assessments (section H4.2 on page 353)
  - Connected properties (section H4.2 on page 353)
  - Charges, bills and cost recovery (section H4.3 on page 354)
  - Urban water supplied (section H4.4 on page 354)
  - Operating cost and management cost (section H4.5 on page 354)
  - Drinking water quality compliance (section H4.6 on page 355)
  - Sewage treatment works compliance (section H4.7 on page 356)
  - Implementation of Best-Practice Management Framework (section H5 on page 356)
- (3) **Figures and tables** – Most of the figures in this report show performance indicators for each of the last six years to enable review of trends and to facilitate benchmarking and ‘yardstick’ comparisons. The figures show ranked results for LWUs grouped into four size ranges in order to enable each LWU to compare its performance against similar sized LWUs. The better performing LWUs are shown at the left of each group.  
  
 Table 5 and Tables 6 to 18 show water supply and sewerage performance indicators for each of the 109 NSW water utilities (105 LWUs plus Sydney Water Corporation and Hunter Water Corporation, Water NSW (from January 2015, formerly Sydney Catchment Authority) and Hawkesbury Council).  
  
 As noted on page 2, these tables are sorted in order of the number of connected properties served in order to facilitate comparisons with similar sized LWUs. The table on page 2 shows each LWU’s ranking in terms of water supply connected properties. For example, the table shows ‘11 Albury City’, indicating that Albury City is the 11th largest LWU. To facilitate comparisons, the tables are also grouped into the same four size ranges as for the figures. Also, the median for many of the indicators are shown for each size grouping.
- (4) **Statewide medians** – This report refers to statewide medians which are calculated on a ‘percentage of connected properties’ basis rather than a ‘percentage of LWUs’ basis. This is a weighted median on the basis of connected properties, which best reveals statewide performance by giving due weight to larger LWUs and reducing the effect of smaller LWUs. LWU rankings on a ‘percentage of LWUs’ basis are also provided where appropriate (e.g. for comparison of LWUs in the ‘Ranking’ columns of the two page TBL Performance Report for each utility (example on page 30 and in Appendix C on page 274). Statewide medians are shown in Tables 1, 2 and 2A on pages 105, 106 and 107. Table 4 on page 111 shows trends in statewide performance indicators for regional NSW and comparisons with the national median for the 80 utilities reported in the National Performance Report 2014-15 for Urban Water Utilities. This data provides valuable contextual information to inform each LWU’s future water supply and sewerage planning and to supplement the water planning information reported by each LWU (final paragraph of footnote 5 on page 3).
- (5) **Typical residential bill (TRB)** – The typical residential bill per assessment is the annual bill paid by a residential customer using the LWU’s average annual residential water supplied and is the principal indicator of the overall cost of a water supply or sewerage system. Pensioners pay a lower amount due to the \$87.50 pensioner rebate as do owners of vacant lots as they pay no water usage charges. Refer also to page 17.

**Calculation of TRB** – The 2015-16 typical residential bill is based on a customer of the LWU's principal water supply or sewerage system using the LWU's 2014-15 average annual residential water supplied (see Tables 6 and 7 on pages 134 and 146). The typical residential bill for 2014-15 and previous years is based on the reported average annual residential water supplied for that year (the 2014-15 residential water supplied is shown in column 17 of Table 5 on page 116). Refer also to section H4.3 on page 354.

- (6) **Total urban water supplied** – Total urban water supplied comprises the sum of the potable water supplied plus the non-potable water supplied (column 2 of Table 5 on page 116 and Figure 9 on page 47). Recycled water is a component of the non-potable supply which also includes raw water.
- (7) **Average annual residential water supplied** – The average annual residential water supplied per connected property (col 17 of Table 5) includes both potable and non-potable water supplied. Where an LWU has not separately reported its residential water supplied, it has been estimated using the statewide average of 58 per cent of the LWU's total potable water supplied. The potable residential water supplied per property is shown in column 14a of Table 6 on page 134. The potable water supplied and the total water supplied (potable + non-potable) have been separately reported for the 12 LWUs with a dual water supply (see note 8 below).
- (8) **Dual supplies** – Twelve LWUs had a dual water supply to over 50 per cent of their residential customers in July 2014 (i.e. with a potable supply for indoor use and a non-potable supply for outdoor use).

The total annual residential water supplied (i.e. potable + non-potable) kilolitres per property for those LWUs with a dual water supply is shown below, together with their potable residential water supplied in brackets. These volumes were: Balranald 660 (167), Berrigan 399 (241), Bourke 1,243 (284), Brewarrina 1,391 (614), Central Darling 581 (128), Hay 1,048 (159), Jerilderie 1,242 (219), Murray 280 (168), Wakool 502 (142), Walgett 1,341 (720), Warren 752 (328) and Wentworth 504 (99).

The TRB has been calculated for those LWUs with a dual supply using the above volumes.

- (9) **Water losses** – For consistency with national and international performance reporting, water losses comprise *Real Losses* (mostly leakage) plus *Apparent Losses* (under-registration of customer meters and illegal use). *Unbilled Water* supplied (firefighting and mains flushing) is not a water loss but is a component of non-revenue water (NRW) (below and note 10). Real losses and NRW apply to the potable water supply only.

As noted on page 16, NWI Indicator A10 (real losses in L/connection/d) is the relevant measure for **tracking a LWU's leakage performance over time** for most LWUs. Each LWU's real losses (L/connection/d) are shown in column 18 of Table 5 on page 116, column 41 of Table 10 on page 172 and Figure 28 on page 66. Refer also to figure 34 on page 112.

Due to perverse impacts shown on page 15, it is inappropriate to track a utility's leakage as a percentage of the total water supplied. Similarly, use of Unaccounted for Water (UFW) is not appropriate. Rather 'Non Revenue Water (NRW)' (L/connection/d) should be used, as recommended by the International Water Association – Reference: Kenneth J Brothers, Assessing UFW and Variable Water Rate Impacts, Use and Loss Metrics in a Declining Water Consumption Environment, IWA Water Loss Conference, 2012, February 2012, Manila, Philippines.

NRW (L/connection/d) is shown in column 41f of Table 10 on page 172 and Figure 29 on page 67.

In addition, the 2014-15 adopted volume of NRW (NWI Indicator W10.1) and NRW as a percentage of the total potable water supplied are shown in columns 15 and 16 of Table 8A on page 159.

- (10) **Minimum real loss and NRW** – Further to note 9 above, the NSW Performance Monitoring System determines minimum values for each LWU's real loss and NRW as shown below.

Leakage studies for 74 NSW LWUs indicate an average leakage from potable water supply distribution systems of 3% to 13% of total potable water supplied, as shown in column 41e of Table 10 on page 172. These utilities have recently carried out a reservoir drop test, waste metering or night flow analysis to determine their real losses and opportunities for leakage reduction. Only 13 of these utilities had a real loss of under 6%. In addition, Table 10A on page 175 discloses the real losses for 68 LWUs 'before' and 'after' leakage reduction under the Regional NSW Water Loss

Management Program<sup>21</sup>. For these LWUs, Table 10A indicates average real losses of 10% of the potable water supplied after leakage reduction.

Accordingly, a minimum real loss (mostly leakage) of 6% of the total potable urban water supplied (NWI Indicator W11.1) has been adopted. Reported real losses of less than 6% have only been accepted where the utility has provided evidence to support the adoption of a lower value. Where such evidence has not been provided, real losses have been increased to 6% of the total potable urban water supplied (W11.1) and are shown in italics bold in column 8 of Table 8 on page 155. Refer also to the final paragraph below on NRW and to the 3rd paragraph of page 16.

Similarly, statewide analysis of **NRW** (*Real Losses*, *Apparent Losses* and *Unbilled Water* supplied (refer to note 9 above)) for NSW water utilities other than bulk water suppliers, indicates a minimum of 10% of the potable water supplied.

Accordingly, a **minimum NRW** of 10% of the total potable urban water supplied (W11.1) has been adopted. Where a LWU has reported NRW of less than 10% of the potable water supplied, the reported NRW has been increased to 10%, unless the LWU has provided evidence of a Real Loss of less than 6%. In such cases, the adopted value for NRW has been determined as the Real Loss plus 4%. Any increases to the real loss (above) or to the NRW (W10.1) have also been applied to W11.1. The adjusted values of the real loss, NRW (W10.1) and the total potable urban water supplied (W11.1) are shown in italics bold in columns 8, 9 and 10 of Table 8 on page 155.

- (11) **Sydney Water, Hunter Water and Water NSW** – The performance indicators for Sydney Water Corporation, Hunter Water Corporation and Water NSW (from January 2015, formerly Sydney Catchment Authority) were obtained from the *National Performance Report 2014-15 for Urban Water Utilities*.
- (12) **Bulk storage** – Utilities that provide bulk storage dams for their water supply incur significant capital and operating costs for these facilities, resulting in a higher typical residential bill and operating cost per property (refer to item 5 on page 18). The following 45 regional utilities provided such bulk storage: Armidale, Ballina, Bathurst, Bega Valley, Bourke, Brewarrina, Byron (Mullumbimby), Cabonne, Central Tablelands, Clarence Valley, Cobar, Coffs Harbour, Essential Energy, Eurobodalla, Fish River, Glen Innes-Severn, Gosford, Goulburn Mulwaree, Guyra, Inverell, Kempsey, Kyogle, Lachlan, Leeton, Lithgow, MidCoast, Mid Western Regional, Moree Plains, Orange, Palerang, Parkes, Port Macquarie-Hastings, Richmond Valley, Rous, Shoalhaven, Tamworth, Tenterfield, Tweed, Upper Hunter, Upper Lachlan, Uralla, Warrumbungle, Wingecarribee, Wyong, Yass Valley. Refer also to column 37 of Table 5B on page 123.
- (13) **Unfiltered** – A utility with over 50 per cent of its supply comprising an unfiltered surface water supply i.e. the utility does not have a water treatment works providing filtration and disinfection for >50 per cent of its supply.
 

**Groundwater** – A utility with >50 per cent of its supply comprising good quality unfiltered groundwater.

**Reticulator** – A utility which purchases >70 per cent of its source water from a bulk supplier and reticulates water to householders in its area.

**Bulk supplier** – A utility which provides a bulk water supply to other utilities, rather than reticulating water to householders.

**Dual supply** – A utility with a potable reticulated water supply for indoor uses and a separate non-potable supply reticulated for outdoor uses to over 50 per cent of its residential customers (refer to note 8 on page 33).
- (14) **National Water Initiative (NWI) Indicators** – There are 32 NSW water utilities with >10,000 connected properties including three metropolitan utilities and 29 regional utilities. These utilities have reported their performance in the *National Performance Report 2014-15* ([www.bom.gov.au](http://www.bom.gov.au)) based on a nationally agreed framework of indicator definitions. The reported NWI performance indicators (including key financial performance indicators) have been independently audited. The results that have met the rigorous NWI auditing requirements have been published in the National Performance

<sup>21</sup> Refer to Table 10A on page 175. In addition, results from the Regional NSW Water Loss Management Program (WLMP) are available at <http://www.lgsa.org.au/policy/water/water-loss-management-program>.

Report 2014-15 and are shown in Appendix F on page 316. Appendix F discloses the NSW results for all the approximately 130 NWI performance indicators. Some of the reported non-financial performance indicators failed to meet the NWI auditing requirements. These results have been excluded from both the *National Performance Report 2014-15* and Appendix F. However they have been included in the Figures and in Tables 5 to 18 of this report.

In addition, the reported values for the 30 NWI financial performance indicators have been independently audited for all the NSW local water utilities (footnote 48 on page 353).

- (15) **Reported NWI Indicators** – This report discloses the performance of each of the 105 NSW Local Water Utilities (LWUs) for each of the approximately 130 NWI performance indicators on the following basis:

**Table 5** on page 116 reports the results for NWI indicators C4, W11, F4, P3, P6, P8, H3, H4 (expressed as % population), C9, C15, A8, C13, W12, A10, E4, A14, W27, W26, F1+F2, F22, F28+F29, F16, F17, F18, F11 and F12.

**Table 5A** on page 120 reports the results for NWI indicators F13, F7, F3, the sum of F28 and F29, F19, F22, F23, F20, F21, F25, F8, F24 and F30.

**Table 5B** on page 123 reports the results for NWI indicators C12, C14, E9, E10, E11 and E12.

**Table 5C** on page 126 reports indicators F9, F14, F11, F22, F17, A8, C17, A10, C9, C10, H3 and P3.

**Table 5D** on page 130 reports indicators F10, F15 F12, F22, F18, A14, C11, E4 and P6.

**Table 6** on page 134 reports indicators P1, P1.2, P1.12, P1.3, P1.4, P3, F17, F4, W12 and C4.

**Table 7** on page 146 reports indicators P4.1, P4.2, P6, F18 and C8.

**Table 8** on page 155 reports the results for NWI indicators W8.1, W9.1, W10.1, W11.1, W20, the sum of W21 and W25, W11.2, W8.2, the sum of W9.2 and W10.2, W14, the sum of W22, W23 and W24, W26, W1, W2, W4, W5 and W7.

**Table 8D** on page 166 reports the results for NWI indicators W9.1, W9.2, W9, W11.3, W21 & W28.4.

**Table 9** on page 169 reports the results for NWI indicators C4, C2, C1, A2, A3, A1, F28, F14 & F26.

**Table 10** on page 172 reports the results for NWI indicators A10, A11, A9, A8, C17, W11 and W12.

**Table 10A** on page 175 reports the results for NWI indicators A9, W11.1 and A10.

**Table 11** on page 180 reports the results for NWI indicators F1, F5, F4, F9, F22, F17 and F11.

**Table 12** on page 183 reports the results for NWI indicators H5, H4, H3, C9, C10, C18, C19, C17 and C15.

**Table 14** on page 189 reports the results for NWI indicators C8, C6, C5, A5, A6, A4, F15 and F27.

**Table 15** on page 192 reports the results for NWI indicators A14, E13, W18, W17, E4, E1, E2, E3, W19, E8, W26 and W27.

**Table 16** on page 195 reports the results for NWI indicators F2, F6, F10, F22, F18 and F12.

**Table 17** on page 198 reports the results for NWI indicators E4, C11, C13 and C16.

The results for NWI indicators P8; F3 and F16; F19; C13; A3 and A2; W11; P3; P1.3; F4; C9; C10; A8; W12; A10; F17; F11; C11; E4; A6 and A5; P6; A14; E13; W27; F18 and F12 are shown on Figures 1, 2, 3, 6, 8, 9, 11, 12, 13, 19, 20, 21, 26, 27, 28, 32, 33, 40, 42, 48, 54, 55, 56, 57, 61 and 62 respectively.

The following NWI indicators have not been shown in the tables but can be determined as follows: W16 from (W18–W17), C3 from (C4–C2), C7 from (C8–C6). Indicator H1 refers to the 2011 ADWG for all LWUs.

All the NSW LWUs have complied with indicators H1, H3 and H4. Results for indicator H5 is reported in Table 12 on page 183.

## 6.1 Regional Water and Sewerage Treatment Officers - DPI Water

| Area        | Name            | Mobile       | Email  |
|-------------|-----------------|--------------|--|
| Albury      | Patrick Freeman | 0429 308 954 | <a href="mailto:Patrick.Freeman@dpi.nsw.gov.au">Patrick.Freeman@dpi.nsw.gov.au</a> |
| Alstonville | Terry Call      | 0412 283 768 | <a href="mailto:Terry.Call@dpi.nsw.gov.au">Terry.Call@dpi.nsw.gov.au</a>           |
| Cootamundra | Bernie Barnes   | 0429 604 409 | <a href="mailto:Bernie.Barnes@dpi.nsw.gov.au">Bernie.Barnes@dpi.nsw.gov.au</a>     |
| Dubbo       | Bruce Lamont    | 0458 268 453 | <a href="mailto:Bruce.Lamont@dpi.nsw.gov.au">Bruce.Lamont@dpi.nsw.gov.au</a>       |
| Newcastle   | Graham Campbell | 0419 620 990 | <a href="mailto:Graham.Campbell@dpi.nsw.gov.au">Graham.Campbell@dpi.nsw.gov.au</a> |
| Orange      | Chris Carlon    | 0419 624 526 | <a href="mailto:Chris.Carlon@dpi.nsw.gov.au">Chris.Carlon@dpi.nsw.gov.au</a>       |
| Tamworth    | Trent Betts     | 0417 458 247 | <a href="mailto:Trent.Betts@dpi.nsw.gov.au">Trent.Betts@dpi.nsw.gov.au</a>         |
| Wollongong  | Geoff Parish    | 0427 248 007 | <a href="mailto:Geoff.Parish@dpi.nsw.gov.au">Geoff.Parish@dpi.nsw.gov.au</a>       |

As noted on pages 10 and 24, assistance is available from your DPI Water Regional Water and Sewerage Treatment Officer for achieving microbiological water quality compliance and for addressing other water and sewage treatment issues.

## 6.2 National Certification Framework for Water Treatment Operators

### National Certification Framework for Water Treatment Operators

Appendix I on page 360 discloses that **each** of the **91 NSW LWUs** responsible for providing water treatment<sup>#</sup> has at least one **fully qualified water treatment operator\*** to operate the 163 LWU water treatment works and 73 chlorinators and aerators<sup>+</sup>.

The LWUs have a **total** of **348** fully qualified operators, who meet the requirements of the National Certification Framework for Water Treatment Operators. Continuing professional development of operators is required, such as attending a DPI Water Treatment Update Seminar at least every 3 years.

In addition, 419 LWU operators are fully qualified Wastewater Treatment Operators, with a Certificate III in Water Operations (Wastewater Treatment) or equivalent and are employed as the operator of a LWU sewage treatment works. Such operators meet the NSW Certification requirements.

<sup>#</sup> Excludes the 9 LWUs responsible for sewerage only (page 2), reticulators Cootamundra, Harden, Queanbeyan and Young, and Cobar Water Board which provides a bulk raw water supply.

<sup>\*</sup> An operator of a water treatment works must have a Certificate III in Water Operations (Water Treatment) or equivalent and must be employed in operating a LWU treatment works or a chlorinator/aerator (refer to page 23 of *NSW Guidelines for drinking water management systems*, NSW Health and NSW Office of Water, 2013 (<http://www.health.nsw.gov.au/environment/water/Documents/NSW-Guidelines%20for-Drinking-Water-Management-Systems.pdf>)).

<sup>+</sup> An operator of a chlorinator or aerator must have a DPI Water Part 1 Certificate (Chemical Dosing Systems) or equivalent, must have also completed chlorine safety training and must be employed in operating a LWU chlorinator/aerator (refer to page 23 of *NSW Guidelines for drinking water management systems*).

## 6.3 The Australian Urban Water Sector

Appendix K on page 364 discusses the **characteristics of the Australian urban water sector**.

**NSW vs Australian Totals** – Appendix K shows that the total populations receiving water supply and sewerage services in NSW are 32% and 34% respectively of the Australian totals of 22.2 million and 20.7 million. The volume of urban water supplied in NSW is 32% of the Australian total of 2,760 GL, and the recycled water supplied in NSW is 32% of the Australian total of 269 GL.

The water and sewerage revenue for NSW is 25% of the Australian total of \$17.4 billion, the operating cost is 25% of the Australian total of \$8.3 billion and capital expenditure is 31% of the Australian total of \$3.6 billion.

NSW has 30% of the 201,000 km of Australian water mains, 33% of the 151,000 km of Australian sewerage mains and channels, 32% of the 558 Australian water treatment works and 40% of the 869 Australian sewage treatment works.

## 6.4 Contents of tables 5 to 18

|                 |   |
|-----------------|---|
| Table 5         | 2014-15 NSW water utility performance summary – Overview of each water utility's key water supply and sewerage performance indicators.  |
| Table 5A        | Water supply and sewerage – financial – Combined water supply and sewerage indicators.  |
| Table 5B        | Water supply and sewerage – levels of service, environmental, main sources of water – Combined water supply and sewerage indicators.  |
| Table 5C        | Water supply – Infrastructure Asset Condition and Performance 2014-15   |
| Table 5D        | Sewerage – Infrastructure Asset Condition and Performance 2014-15   |
| Table 6         | Water supply – residential charges, bills, cost recovery – Type of tariff, residential charges, bills, cost recovery, average annual residential water supplied and number of connected properties  |
| Tables 6A to 6B | Water supply – 2014-15 residential inclining block or multiple tariffs, non-residential tariffs   |
| Table 7         | Sewerage – residential charges, bills, cost recovery – Residential charges, bills, non-residential sewer usage charge, cost recovery and number of connected properties for each water utility's sewerage business  |
| Tables 7A to 7C | Sewerage – 2014-15 residential multiple tariffs, non-residential tariffs, liquid trade waste fees and charges   |
| Table 8         | 2014-15 NSW urban water supplied – Water supplied by customer category, water losses, leakage, non-revenue water, total potable and non-potable water supplied, recycled water use and surface and groundwater use  |
| Table 8A        | 2014-15 Water losses and non-revenue water  |
| Table 8B        | 2014-15 Water consumptions from source catchments in regional NSW – Shows details of water consumptions by customer category for each source catchment  |
| Table 8C        | 2014-15 Water conservation initiatives  |
| Table 8D        | 2014-15 Components of commercial, industrial and rural water supplied, municipal water used, potable water produced, urban stormwater used  |
| Table 9         | Water supply – utility characteristics – Population [permanent, peak], no. of assessments, no. of service connections, connected properties, new residential dwellings connected, assets employed, capital investment, workforce employed, employees undergoing training, outsourcing, days lost        |
| Table 10        | Water supply – asset management, water resource management – Leakage, Non-Revenue Water (NRW), main breaks, interruptions to supply, rehabilitations, renewals and maintenance expenditure, total annual & average residential water supplied, recycled water use, drought & demand management policies |
| Table 10A       | Estimated Real Water Losses from Regional Water Loss Management Program – Zone, ILI before, estimated water loss - before and after, annual water savings, leakage test and the test year   |
| Table 11        | Water supply – financial, efficiency – Revenue, residential revenue and water supplied, current replacement cost, net debt to equity, cross subsidies, operating result, externalities, loan payment, operating cost (OMA) and management cost  |
| Table 12        | Water supply – health, levels of service – Physical, chemical and e. coli water quality compliance, water quality complaints, water service complaints, customer inquiries, customer restrictions and legal action, customer interruption incidence and drought water restrictions                      |
| Table 13        | Water Supply – benchmarking cost data – Disaggregated benchmarking cost data including operating cost, management cost, retail/wholesale cost, pumping cost, treatment cost and water main cost (pages 111, 112, 275)   |
| Table 14        | Sewerage – utility characteristics – Population (permanent, peak), no. of assessments, connected properties, new residential dwellings connected, assets employed, capital investment, workforce employed, employees undergoing training, outsourcing, days lost  |
| Table 15        | Sewerage – asset management, resource management – Infiltration, interruptions to service, rehabilitations, renewals, maintenance expenditures, volume of sewage collected/treated, biosolids reused, per cent effluent reclaimed   |
| Table 16        | Sewerage – financial, efficiency – Revenue, current replacement cost, debt to equity, cross subsidies, operating result, externalities, loan payment, operating cost (OMA) and management cost  |
| Table 17        | Sewerage – environmental, levels of service – BOD and SS compliance, sewage treated that was compliant, STW compliance, odour complaints, service complaints, customer inquiries, average sewerage interruption   |
| Table 18        | Sewerage – benchmarking cost data – Disaggregated benchmarking cost data including operating cost, management cost, retail / wholesale cost, pumping cost, treatment cost and sewer main cost (pages 114, 277)  |

## 7. WATER SUPPLY AND SEWERAGE FIGURES

Figure 1: Typical residential bill – water supply and sewerage - P8

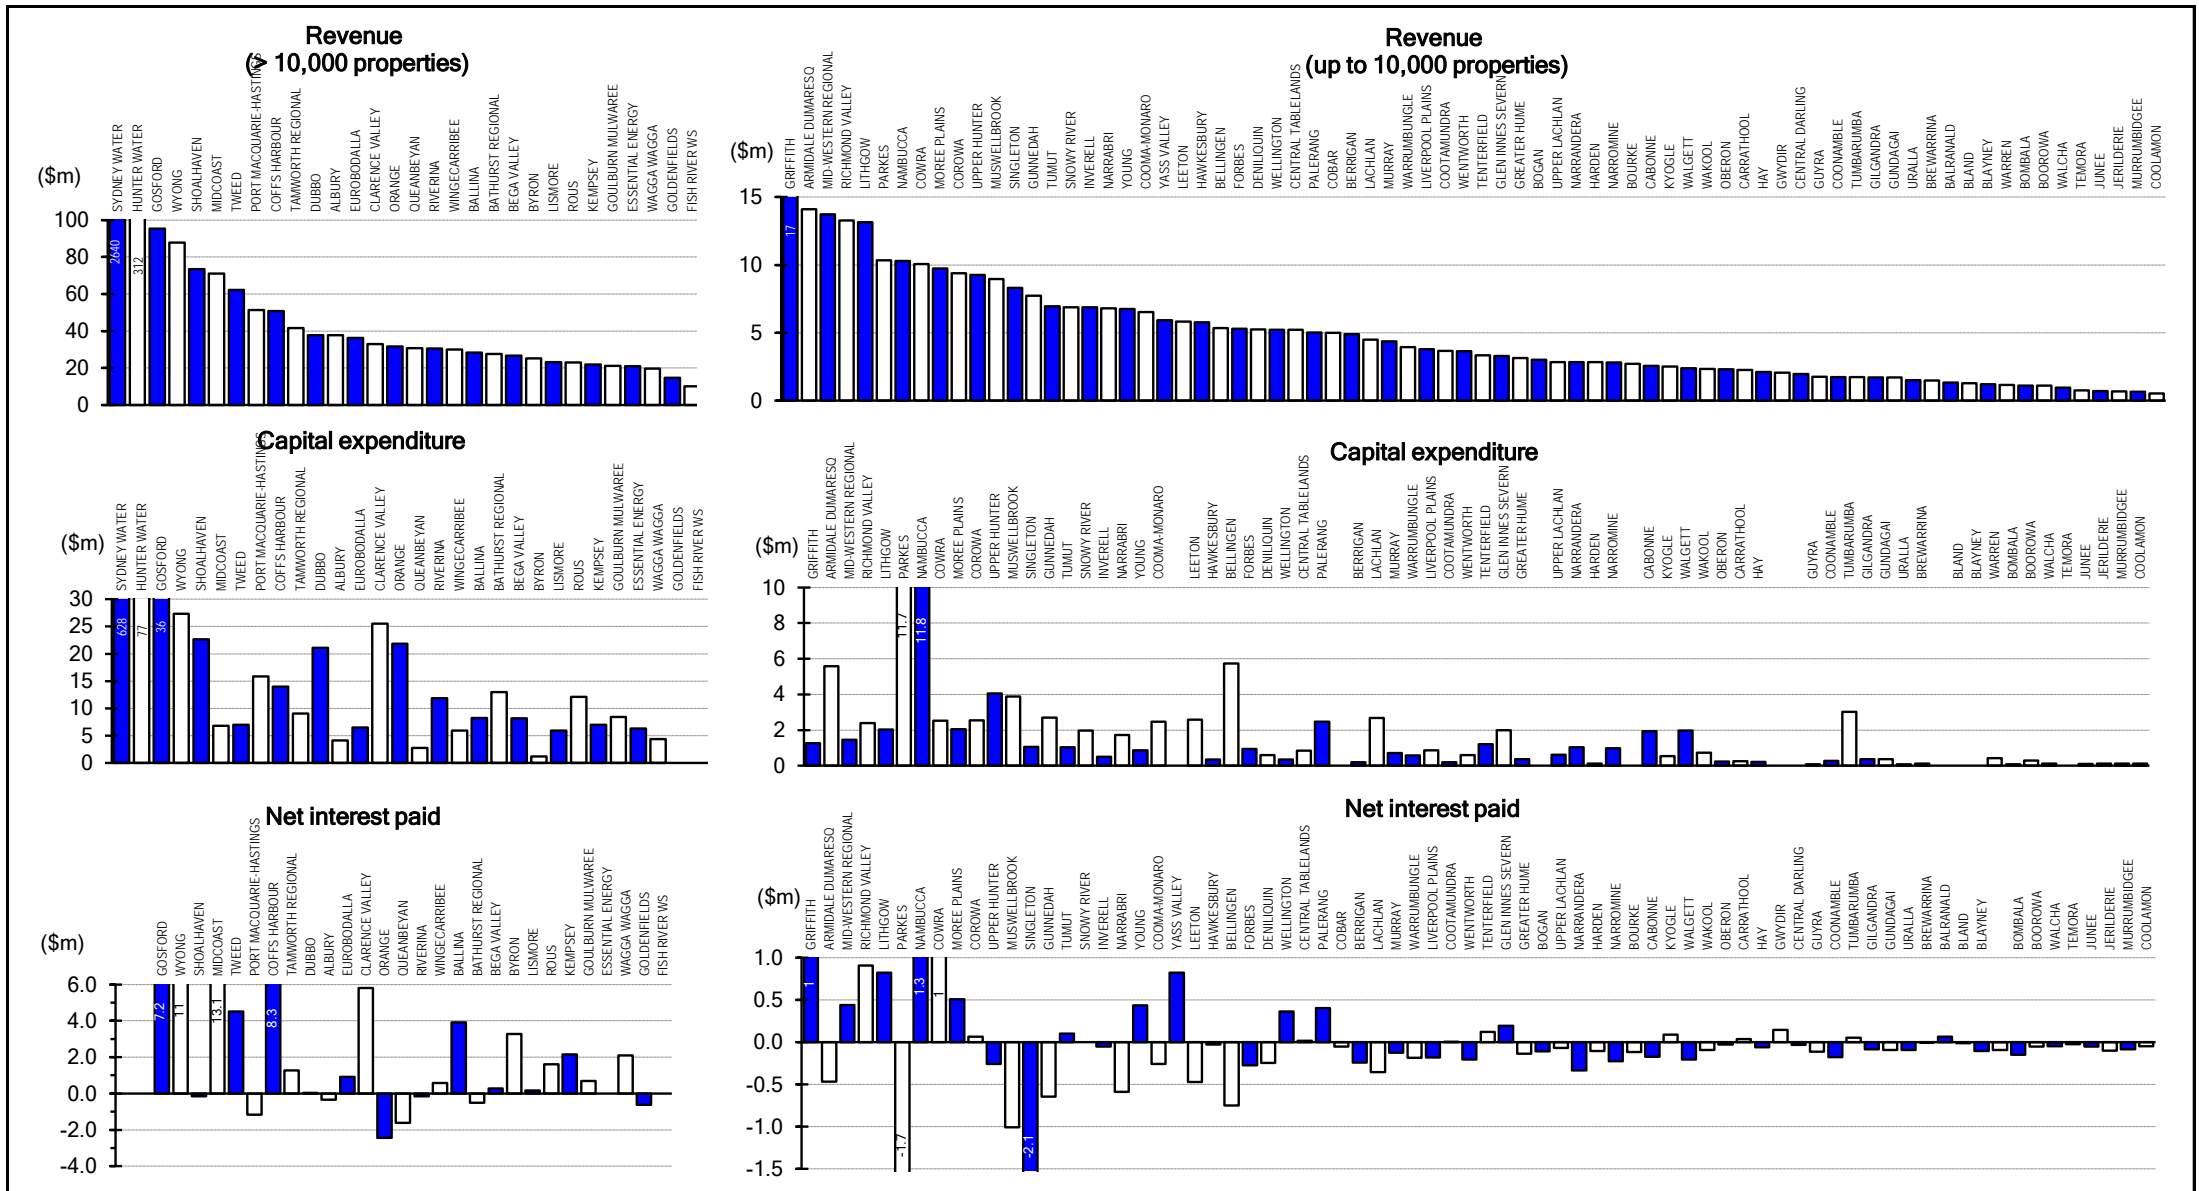

**Parameter:** (2014-15 Average Residential Water Supplied x 2015-16 Water Usage Charge) + 2015-16 Water and Sewerage Access Charges

**Notes:**

1. This figure shows ranked values of the 2015-16 typical residential water bill for water supply and sewerage for each Local Water Utility (LWU) in 4 groups based on the number of connected properties served – over 10,000, 3,001 to 10,000, 1,501 to 3,000 and 200 to 1,500. Each white bar represents one LWU. As an example, for the second graph (property range from 3,001 to 10,000), the 2015-16 typical residential water bill for water supply and sewerage for the 24 LWUs shown ranges from \$987 to \$1780. Results for the previous 5 years are also shown in Jan 2016\$.
2. The 2015-16 Statewide median typical residential bill for water supply and sewerage is \$1,290 per assessment [National Median is \$1320 for 2014-15]. Refer also to Table 5 on page 116, graph 7 on page 206 and figure 2a on page 115.
3. Refer also to pages 7 and 33 of the *2014-15 NSW Water Supply and Sewerage Performance Monitoring Report* ([www.water.nsw.gov.au](http://www.water.nsw.gov.au)).
4. For general notes see page 32.

Figure 2: Revenue (F1 + F2), capital expenditure (F16), net interest paid - water supply and sewerage

**Parameter:** [Total revenue (W\_13 + S\_14) - grants for acquisition of assets (W\_11a + S\_12a)] ÷ 1,000,000

**Parameter:** Acquisition of fixed assets (W\_16 + S\_17)

**Parameter:** Interest expense (W\_4a + S\_4a) - interest income (W\_9 + S\_10)

**Notes:**

1. Utilities are ranked on the basis of revenue (see the top graph). Revenue for Sydney Water was \$2,640M and Hunter Water's revenue was \$312M.
2. Refer also to Table 3 on page 108, Table 5 on page 116 and graphs 30 and 31 on page 212.
3. For general notes see page 32.

Figure 3: Net debt, economic real rate of return (F19) - water supply and sewerage

**Parameter:** [Borrowings (W\_39 + S\_40) + bank overdraft (W\_37 + S\_38)] - cash and investments (W\_30 + S\_31)

**Parameter:** [Revenue from operations (W\_13 + S\_14) - OMA & current cost depreciation (W\_1 + W\_2 + W\_3 + S\_1 + S\_2 + S\_3) - interest income (W\_9 + S\_10) - grants for acquisition of assets (W\_11a + S\_12a)]  
Written down replacement cost of system assets, plant & equipment (W\_47 + W\_33b + S\_48 + S\_34b)

#### Notes:

- Utilities are ranked on the basis of revenue (see the top graph). Revenue for Sydney Water was \$2,640M and Hunter Water's revenue was \$312M.
- Refer also to Table 5 on page 116, Table 5A on page 120, graphs 24 and 27 on page 211 and figure 13 on page 115.
- For general notes see page 32.

Figure 4: Typical developer charge - water supply and sewerage

**Parameter:** Typical Water Supply Developer Charge (WB136) + Typical Sewerage Developer Charge (SB62)

**Notes:**

1. This figure shows ranked values of the 2015-16 typical developer charge for water supply and sewerage for each Local Water Utility (LWU) in 4 groups based on the number of connected properties served – over 10,000, 3,001 to 10,000, 1,501 to 3,000 and 200 to 1,500. Each white bar represents one LWU. As an example, for the second graph (property range from 3,001 to 10,000), the typical developer charge for water supply and sewerage for the 24 LWUs shown ranges from \$22060 to \$2900. Results for the previous 5 years are also shown in Jan 2016\$.
2. The 2015-16 Statewide median typical developer charge for water supply and sewerage is \$11000 per Equivalent Tenement (ET). Refer also to Table 5 on page 116.
3. For general notes see page 32.

Figure 5: Total complaints - water supply and sewerage - C13

**Parameter:**  $\frac{[\text{No. of Water Complaints (WB102)} + \text{No. of Sewerage Complaints (SB40)}] \times 1000}{[\text{No. of Residential Assessments (WB32)} + \text{No. of Non-Residential Assessments (WB33)}] \times \text{No. of Connected Properties per Assessment}}$

- Notes:**
1. This figure shows ranked values of the 2014-15 total number of water supply and sewerage complaints per 1000 connected properties for each Local Water Utility (LWU) in 4 groups based on the number of connected properties served – over 10,000, 3,001 to 10,000, 1,501 to 3,000 and 200 to 1,500. Each white bar represents one LWU. As an example, for the second graph (property range from 3,001 to 10,000), the total water supply and sewerage complaints for the 26 LWUs shown ranges from nil to 138 per 1,000 connected properties.
  2. The Statewide median total number of water and sewerage complaints is 19 per 1,000 properties [National Median is 4 per 1,000 properties]. Refer also to figure 5 on page 115 and pages 183 and 198.
  3. For general notes see page 32.

## 8. WATER SUPPLY FIGURES

**Figure 6: Properties served per km of main, length of mains - water supply - A3**

**Parameter:** 
$$\frac{\text{No. of residential assessments (WB32)} + \text{No. of non-residential assessments (WB33)} \times \text{No. of connected properties per assessment}}{\text{Length of headworks transfer mains (WB20a)} + \text{length of trunk mains (WB20)} + \text{length of reticulation mains (WB21)}}$$

**Parameter:** Length of headworks transfer mains (WB20a) + length of trunk mains (WB20) + length of reticulation mains (WB21)

**Notes:**

1. The top graph shows the ranked values of number of connected properties per km of water main for each Local Water Utility (LWU). Each bar represents one LWU. The bottom graph of this figure shows the total length of mains for the corresponding LWUs.
2. The Statewide median water supply connected properties per km of main is 31 [National Median is 34 per km of main]. Refer also to Table 9 on page 169 and graph 1 on page 205.
3. For general notes see page 32.

Figure 7: Rainfall, temperature - water supply

**Parameter:**  $[2014/15 \text{ total rainfall} \times 100] \div \text{Long term median annual rainfall}$

**Parameter:** 2014/15 total rainfall (mm)

**Parameter:**  $[2014/15 \text{ average daily maximum temperature} \times 100] \div \text{Long term median of daily maximum temperature}$

**Notes:**

1. Rainfall, temperature and medians are sourced from the Bureau of Meteorology. Long term medians are not available for some localities.
2. The total rainfall for the 2014/15 financial year and the average daily maximum temperature are only shown if weather stations returned complete records.
3. Weather stations are selected on the basis of proximity to a utility's major population centre and the length and reliability of records.
4. The statewide median annual rainfall was 116% of the long term median. However, the top graphs above show that the weighted medians for the coastal and inland utilities were 128% and 94% respectively.
5. For general notes see page 32.

Figure 8: Total water supplied - water supply - W11

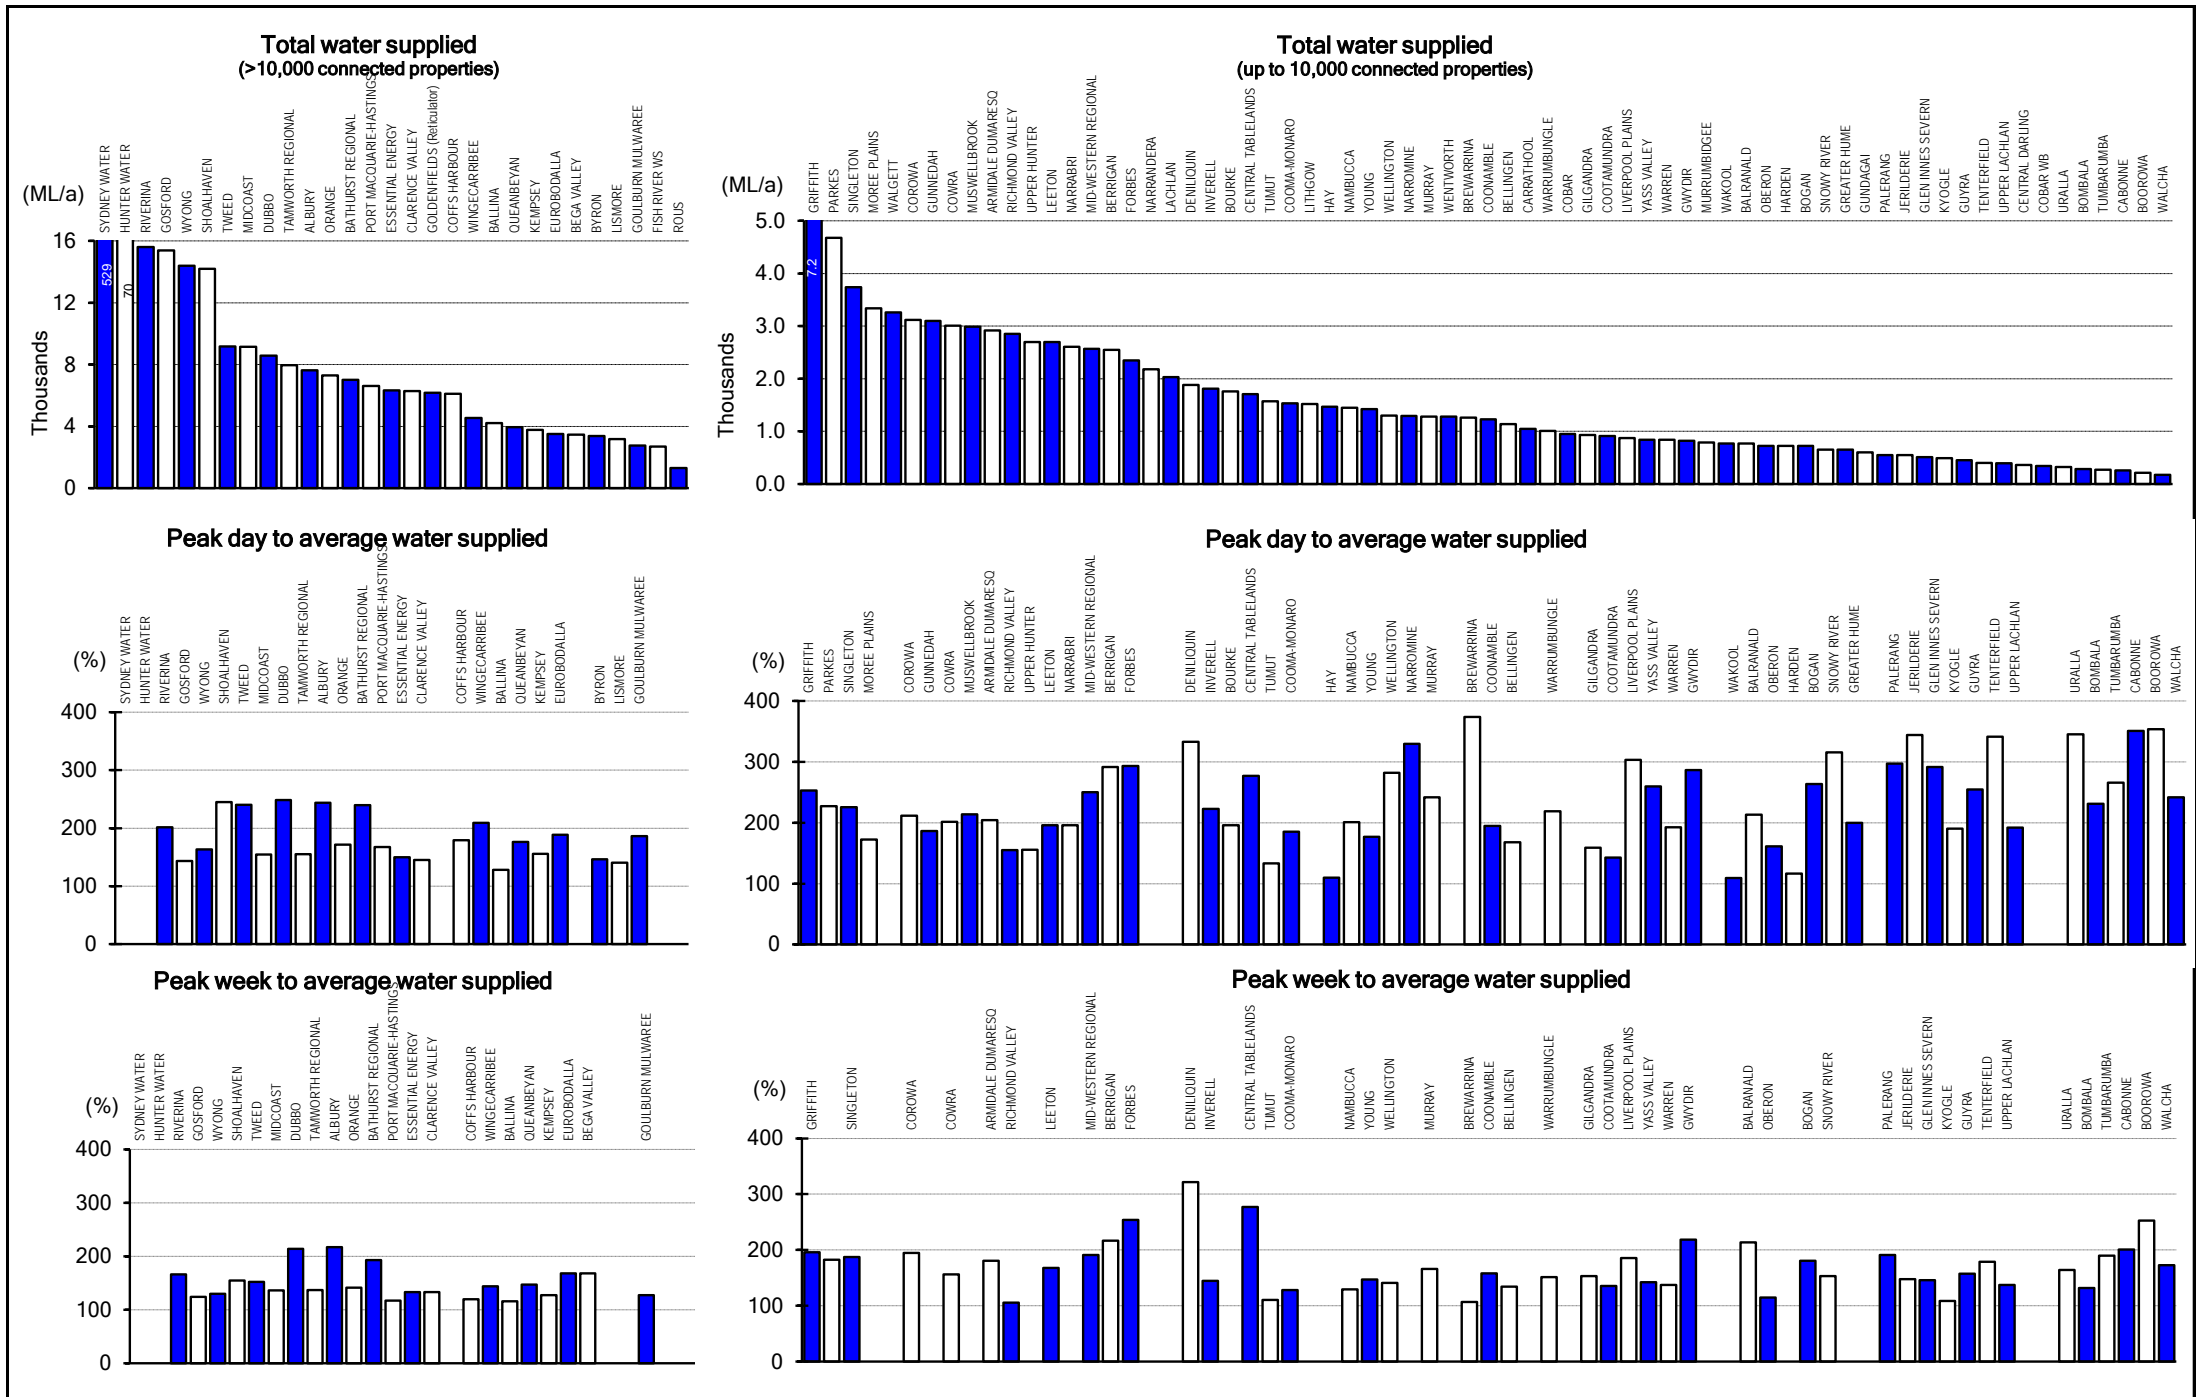

Figure 8: Total water supplied - water supply (continued)

**Figure 9: Total urban water supplied - water supply - W11**

**Parameter:** Total Potable Water Supplied (WB62) + Non-Potable Water Supplied (WB64) + Recycled Water (WB158)

**Notes:**

1. This figure shows ranked values of the 2014-15 total urban water supplied for each Local Water Utility (LWU) in 4 groups based on the number of connected properties served – over 10,000, 3,001 to 10,000, 1,501 to 3,000 and 200 to 1,500. Each white bar represents one LWU. As an example, for the second graph (property range from 3,001 to 10,000), the total urban water supplied for the 28 LWUs shown ranges from 7,220 to 650 ML/a. Results for the previous 5 years are also shown.
2. The Statewide median total urban water supplied is 7000 ML/a [National Median is 9060 ML/a]. Refer also to Table 5 on page 116 and Table 10 on page 172.
3. For general notes see page 32.

Figure 10: Employees per 1,000 properties - water supply

**Parameter:**  $\text{Equivalent Full-time Employees (WB120)} \times 1000$

$[\text{No. of Residential Assessments (WB32)} + \text{No. of Non-Residential Assessments (WB33)}] \times \text{No. of Connected Properties per Assessment}$

**Notes:**

1. This figure shows ranked values of the 2014-15 number of water supply employees per 1000 properties for each Local Water Utility (LWU) in 4 groups based on the number of connected properties served – over 10,000, 3,001 to 10,000, 1,501 to 3,000 and 200 to 1,500. Each white bar represents one LWU. As an example, for the second graph (property range from 3,001 to 10,000), the water supply employees per 1000 connected properties for the 28 LWUs shown ranges from 0.6 to 3.8. Results for the previous 5 years are also shown.
2. The Statewide median number of water supply employees is 1.4 per 1000 connected properties. Refer also to pages 21, 23, 27 and Table 9 on page 169.
3. For general notes see page 32.

Figure 11: Typical residential bill – water supply

Figure 12: Residential usage charge [P1.3] and access charge [P1.2] - water supply

- Notes:**
1. ALL LWUs abolished their free water allowance for potable water supply by 2007. All LWUs now have domestic water metering.
  2. The first step residential water usage charge is shown above. Further information on water supply tariff structures is shown in Tables 6, 6A and 6B. Refer also to Table 6 on page 134 and graph 3 on page 206.
  3. The Statewide median water usage charge for the first step was 226 c/kL [National Median is 185 c/kL for 2014-15]. 20% of LWUs had a usage charge greater than 270 c/kL. 80% of LWUs had a usage charge greater than 160 c/kL. Refer also to figure 12 on page 111.
  4. For general notes see page 32. Refer also to page 13.

Figure 13: Residential revenue from usage charges - water supply - F4

**Parameter:**  $\frac{\text{Revenue from residential user charges (W\_6b)} \times 100}{\text{Revenue from residential access charges (W\_6a)} + \text{Revenue from residential user charges (W\_6b)}}$

**Notes:**

1. This figure shows ranked values of the 2014-15 residential revenue from usage charges for each Local Water Utility (LWU) in 4 groups based on the number of connected properties served – over 10,000, 3,001 to 10,000, 1,501 to 3,000 and 200 to 1,500. Each white bar represents one LWU. As an example, for the second graph (property range from 3,001 to 10,000), the residential revenue from usage charges for the 28 LWUs shown ranges from 83 to 39 percent. Results for the previous 5 years are also shown.
2. The Statewide median residential revenue from water usage charges was 72%, which provides a strong pricing signal [National Median is 66%]. Refer also to page 24, Table 5 on page 116, Table 6 on page 134, Table 3 on page 108, graph 4 on page 206 and figure 16 on page 111. Refer also to page 5 of the 2014-15 Water Supply and Sewerage Performance Monitoring Report ([www.water.nsw.gov.au](http://www.water.nsw.gov.au)).
3. For general notes see page 32.

Figure 14: Typical developer charge – water supply

**Notes:**

1. This figure shows ranked values of the 2015-16 typical developer charge for water supply for each Local Water Utility (LWU) in 4 groups based on the number of connected properties served – over 10,000, 3,001 to 10,000, 1,501 to 3,000 and 200 to 1,500. Each white bar represents one LWU. As an example, for the second graph (property range from 3,001 to 10,000), the typical developer charge for water supply for the 28 LWUs shown ranges from \$12800 to \$900. Results for the previous 5 years are also shown in Jan 2016\$.
2. The 2015-16 Statewide median typical developer charge for water supply is \$5,900 per equivalent tenement (ET), which is 36% of the median current replacement cost of water supply system assets of \$16,400 per assessment. Refer also to Table 6 on page 134.
3. 85 LWUs levied water supply developer charges.
4. 83% of LWUs have an appropriate water supply Development Servicing Plan (DSP) with commercial developer charges. This includes the following 12 utilities which have received an exemption from needing to levy commercial water supply developer charges due to their low growth of under 5 lots/a - Bogan, Boorowra, Bourke, Brewarrina, Central Darling, Coonamble, Essential Energy, Gilgandra, Hay, Kyogle, Tumbarumba and Warren.
5. For general notes see page 32.

Figure 15: Physical water quality compliance - water supply

**Parameter:** Percentage of distribution system water samples complying with physical criteria of the NHMRC/NRMMC Australian Drinking Water Guidelines 2011.

- Notes:**
1. This figure shows ranked values of the 2014-15 distribution system compliance with the NHRMC/NRMMC Australian Drinking Water Guidelines 2011 for physical water quality for each Local Water Utility (LWU) in 4 groups based on the number of connected properties served – over 10,000, 3,001 to 10,000, 1,501 to 3,000 and 200 to 1,500. Each white bar represents one LWU. As an example, for the second graph (property range from 3,001 to 10,000), the physical water quality compliance for the 28 LWUs shown are all 100%. Results for the previous 5 years are also shown.
  2. For an LWU to comply with the 2011 Australian Drinking Water Guidelines for physical water quality (aesthetic), the required number of samples must be tested (refer to page 235) and the mean of results must not exceed the guideline value for each characteristic. The result for such an LWU is shown as '100%' in this figure. Non-potable water supplies are excluded.
  3. 98.3% of the 4,600 samples tested in 2014-15 achieved 100% compliance with these guidelines. 100% of LWUs complied with the guidelines in 2014-15.
  4. For LWUs with more than one water treatment works, the reported compliance has been pro-rated on the basis of the number of samples tested at each treatment works. Appendix D1 on page 280 provides the 2014-15 results for each treatment works.
  5. The Statewide median physical water quality compliance is 100%. Refer also to Table 12 on page 183.
  6. For general notes see page 32.

Figure 16: Chemical water quality compliance - water supply

**Parameter:** Percentage of distribution system water samples complying with chemical criteria of the 2011 NHMRC/NRMMC Australian Drinking Water Guidelines.

- Notes:**
1. This figure shows ranked values of the 2014-15 distribution system compliance with the 2011 NHRMC/NRMMC Australian Drinking Water Guidelines for chemical water quality for each Local Water Utility (LWU) in 4 groups based on the number of connected properties served – over 10,000, 3,001 to 10,000, 1,501 to 3,000 and 200 to 1,500. Each white bar represents one LWU. As an example, for the second graph (property range from 3,001 to 10,000), the chemical water quality compliance for the 28 LWUs shown are all 100%. Results for the previous 5 years are also shown.
  2. 99.9% of the 4,800 samples tested in 2014-15 complied with the 2011 Guidelines. 100% of the LWUs complied with the Guidelines in 2014-15.
  3. For a LWU to comply with the 2011 Australian Drinking Water Guidelines for chemical water quality (health related), the required number of samples must be tested (refer to page 235) and at least the 95th percentile of results must not exceed the guideline value for each chemical. The result for such a LWU is shown as '100%' in this figure. Non-potable water supplies are excluded. For LWUs with more than one water treatment works, the reported compliance has been pro-rated on the basis of the number of samples tested at each treatment works. Appendix D1 on page 280 provides the 2014-15 results for each treatment works. Refer also to Table 5 on page 116 and Table 12 on page 183.
  4. The Statewide median chemical water quality compliance is 100%.
  5. For 2012-13, 2013-14 and 2014-15, the public drinking water supply for 99.9% of the urban population in regional NSW complied with 2011 ADWG for both microbiological and chemical water quality.
  6. For general notes see page 32.

Figure 17: Microbiological water quality compliance - water supply

**Parameter:** Percentage of distribution system water samples complying with E. coli criteria of the 2011 NHMRC/NRMMC Australian Drinking Water Guidelines

**Notes:**

1. This figure shows ranked values of the 2014-15 distribution system compliance with the 2011 NHRMC/NRMMC Australian Drinking Water Guidelines for E. coli for each Local Water Utility (LWU) in 4 groups based on the number of connected properties served – over 10,000, 3,001 to 10,000, 1,501 to 3,000 and 200 to 1,500. Each white bar represents one LWU. As an example, for the second graph (property range from 3,001 to 10,000), the microbiological water quality compliance for the 28 LWUs shown are all 100%. Results for the previous 5 years are also shown.
2. For a LWU to comply with the 2011 Australian Drinking Water Guidelines for microbiological water quality, the required number of samples must be tested (refer to page 235) and at least 98% of the samples must contain no E.coli. The result for such a LWU is shown as '100%' in this figure. Non-potable water supplies are excluded. 99.9% of the 19,400 samples tested in 2014-15 contained no E. coli. 100% of the LWUs complied with the 2011 Guidelines for E. coli in 2014-15. Refer also to page 24.
3. For LWUs with more than one water treatment works, the reported compliance has been pro-rated on the basis of the number of samples tested at each treatment works. Appendix D1 on page 280 provides the 2014-15 results for each treatment works.
4. The Statewide median microbiological water quality compliance is 100%. Refer also to Table 5 on page 116, Table 12 on page 183 and graph 8 on page 207.
5. For 2012-13, 2013-14 and 2014-15, the public drinking water supply for 99.9% of the urban population in regional NSW complied with 2011 ADWG for both microbiological and chemical water quality.
6. For general notes see page 32.

Figure 18: Public health incidents, capital investment - water supply

|            |  |
|------------|--|
| Parameter: | Total No. of Minor Incidents with Inconsequential Effects (WB115)  |
| Parameter: | [No. of Residential Assessments (WB32) + No. of Non-Residential Assessments (WB33)] x No. of Connected Properties per Assessment |
| Parameter: | Total No. of Minor Incidents with Limited Health Impacts (WB116)   |
| Parameter: | [No. of Residential Assessments (WB32) + No. of Non-Residential Assessments (WB33)] x No. of Connected Properties per Assessment |
| Parameter: | Total No. of Major Incidents with Major Health Impacts (WB117)   |
| Parameter: | [No. of Residential Assessments (WB32) + No. of Non-Residential Assessments (WB33)] x No. of Connected Properties per Assessment |
| Parameter: | Capital Expenditure on Improving Health Performance (\$) x (WB119)   |
| Parameter: | [No. of Residential Assessments (WB32) + No. of Non-Residential Assessments (WB33)] x No. of Connected Properties per Assessment |

**Note:**

- 8 Utilities are shown in the figure above, while 87 utilities reported zero public health incidents.
- For general notes see page 32.

Figure 19: Water quality complaints - water supply - C9

**Parameter:**  $\frac{\text{No. of Water Quality Complaints (WB101)} \times 1000}{[\text{No. of Residential Assessments (WB32)} + \text{No. of Non-Residential Assessments (WB33)}] \times \text{No. of Connected Properties per Assessment}}$

**Notes:**

1. This figure shows ranked values of the 2014-15 number of water quality complaints per 1000 connected properties for each Local Water Utility (LWU) in 4 groups based on the number of connected properties served – over 10,000, 3,001 to 10,000, 1,501 to 3,000 and 200 to 1,500. Each white bar represents one LWU. As an example, for the second graph (property range from 3,001 to 10,000), the water quality complaints for the 26 LWUs shown ranges from nil to 35 per 1000 connected properties.
2. The Statewide median number of water quality complaints is 3 per 1000 properties [National Median is 2 per 1,000 properties]. Refer also to Table 5 on page 116, graph 9 on page 207 and figure 25 on page 112.
3. For general notes see page 32.

Figure 20: Complaints (per 1,000 properties) - water supply - C9, C10

Parameter:

Total No. of Complaints [(WB96)+(WB99)+(WB100)+(WB101)] x 1000

Note:

[No. of Residential Assessments (WB32) + No. of Non-Residential Assessments (WB33)] x No. of Connected Properties per Assessment

1. For general notes see page 32. Refer also to Table 5 on page 116, Table 12 on page 183, figures 25 and 26 on page 112, figure 21 on page 114 and figure 5 on page 115.

Figure 21: Number of water main breaks - water supply - A8

Parameter: No. of Pipeline Breaks (WB104) x 100  
Length of Distribution and Trunk Mains (WB22)

- Notes:
1. This figure shows ranked values of the 2014-15 water supply main breaks for each Local Water Utility (LWU) in 4 groups based on the number of connected properties served – over 10,000, 3,001 to 10,000, 1,501 to 3,000 and 200 to 1,500. Each white bar represents one LWU. As an example, for the second graph (property range from 3,001 to 10,000), the number of main breaks for the 28 LWUs shown ranges from 2.3 to 69 per 100km of water mains. Results for the previous 5 years are also shown.
  2. The Statewide median number of water supply main breaks is 9 per 100km of water main [National Median is 13 per 100km of water main]. This has remained much lower than all the other states and capital city utilities, indicating good water main asset condition (graph 10 on page 207 of Appendix A and figure 30 on page 112). Refer also to Table 5 on page 116 and Table 10 on page 172.
  3. For general notes see page 32.

Figure 22: Service connection failures - water supply

Parameter:

No. of Service Connection Failures (WB105) x 100

[No. of Residential Assessments (WB32) + No. of Non-Residential Assessments (WB33)] x No. of Connected Properties per Assessment

Notes:

1. This figure shows ranked values of the 2014-15 water supply service connection failures for each Local Water Utility (LWU) in 4 groups based on the number of connected properties served – over 10,000, 3,001 to 10,000, 1,501 to 3,000 and 200 to 1,500. Each white bar represents one LWU. As an example, for the second graph (property range from 3,001 to 10,000), the number of service connection failures for the 26 LWUs shown ranges from nil to 5%. The 1 LWU on the right did not report this indicator for 2014-15. Results for the previous 5 years are also shown.
2. Refer also to Table 10 on page 172 and columns 48 to 59 of Table 5C on page 126.
3. For general notes see page 32.

Figure 23: Drought water restrictions - water supply

Parameter: No. of Days of Water Restrictions Due to Drought (WB95) x 100  
365 Days

- Notes:
1. This figure shows ranked values of the 2014-15 drought water restrictions due to drought for each Local Water Utility (LWU) in 4 groups based on the number of connected properties served – over 10,000, 3,001 to 10,000, 1,501 to 3,000 and 200 to 1,500. Each white bar represents one LWU. As an example, for the second graph (property range from 3,001 to 10,000), 10 of the 28 reporting LWUs reported restrictions ranging from 38% of the time to 100% of the time. 18 LWUs reported no drought water restrictions. Results for the previous 5 years are also shown.
  2. 30% of the LWUs needed to apply drought water restrictions in 2014-15.
  3. Refer also to Table 12 on page 183 and to page 3 of the 2014-15 NSW Water Supply and Sewerage Performance Monitoring Report ([www.water.nsw.gov.au](http://www.water.nsw.gov.au)).
  4. For general notes see page 32.

Figure 24: Chlorination system malfunction - water supply

Parameter: Number of Days Chlorination System failed to Operate (WB44)

Notes:

1. The figure shows the 2014-15 ranked number of days a chlorination system for potable water did not operate for each Local Water Utility (LWU) in 4 groups based on the number of connected properties served – over 10,000, 3,001 to 10,000, 1,501 to 3,000 and 200 to 1,500. Each white bar represents one LWU. As an example, for the second graph (property range from 3,001 to 10,000), the number of days the chlorination system did not operate for the 27 LWUs shown ranges from nil to 1 days. Results for the previous 5 years are also shown.
2. For LWUs with more than one chlorination system, the weighted average (based on capacity) of days was used. Refer also to Appendix D1 on page 280.
3. For general notes see page 32.

Figure 25: Treatment works malfunction - water supply

Parameter: Number of Days of major Malfunction of Treatment Processes (WB45)

Notes:

1. The figure shows the 2014-15 ranked number of days of treatment works malfunction for each Local Water Utility (LWU) in 4 groups based on the number of connected properties served – over 10,000, 3,001 to 10,000, 1,501 to 3,000 and 200 to 1,500. Each white bar represents one LWU. As an example, for the second graph (property range from 3,001 to 10,000), the number of days of treatment works malfunction for the 27 LWUs shown ranges from nil to 164 days. Results for the previous 5 years are also shown.
2. For LWUs with more than one treatment works, the weighted average days of malfunction (based on treatment works capacity) was used. Refer also to Appendix D1 on page 280.
3. For general notes see page 32.

Figure 26: Average annual residential water supplied - water supply - W12

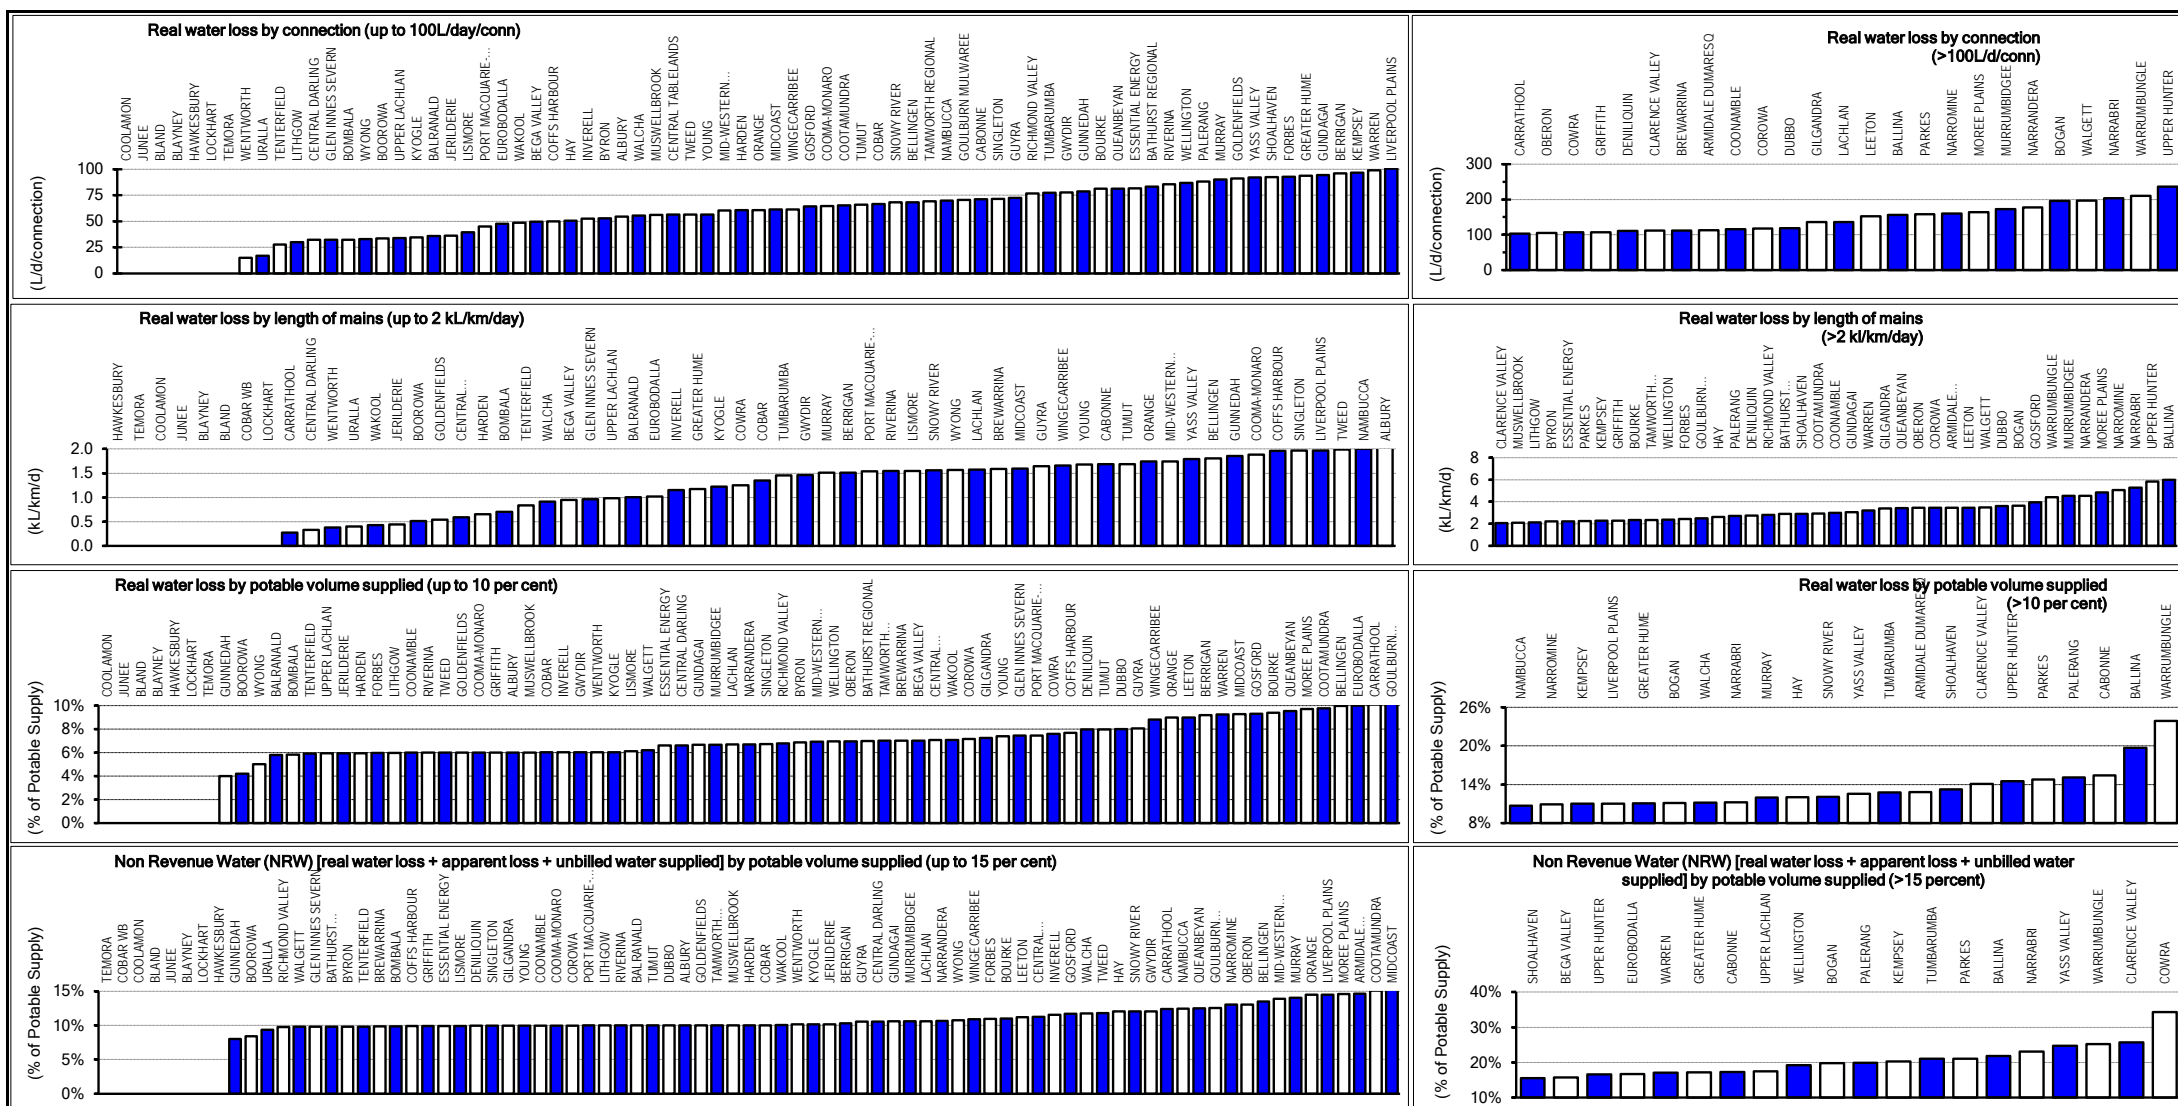

Figure 27: Water losses (real loss (leakage) [A10, A11] and apparent loss) - water supply

Parameter:

Real water losses (WB68) x 1000

Parameter:

No. of service connections (WB30)

Parameter:

Real water losses (WB68) x 100

Parameter:

Length of mains (WB22)

Notes:

$$\frac{\text{Real \& apparent water losses (WB69) + Unbilled water supplied (WB61)}}{\text{Total potable water supplied (WB62)}} \times 100$$

1. Refer to Note 9 of General Notes on page 33 for water losses. Refer also to figures 28 and 29 on pages 66 and 67, Table 5 on page 116, Table 10 on page 172, Table 10A on page 175, graph 13 on page 208 & figure 34 on page 112.
2. For general notes see page 32.

Figure 28: Real losses (L/service connection/d) - water supply - A10

Parameter:  $\frac{\text{Real water losses (WB68)} \times 1000}{\text{No. of service connections (WB30)}}$

- Notes:
1. This figure shows ranked values of the 2014-15 real losses for each Local Water Utility (LWU) in 4 groups based on the number of connected properties served – over 10,000, 3,001 to 10,000, 1,501 to 3,000 and 200 to 1,500. Each white bar represents one LWU. As an example, for the second graph (property range from 3,001 to 10,000), the real losses for the 28 LWUs shown ranges from 30 to 240 L/service connection/d. Results for the previous 5 years are also shown.
  2. The Statewide median real losses is 60 L/service connection/d [National Median is 76 L/service connection/d]. Refer also to Table 10 on page 172.
  3. As a result of the Regional NSW Water Loss Management Program 2006-2011, many utilities have been able to reduce their real losses. Two notable results are Uralla, which reduced losses from 15% to 3% and Snowy River, which reduced losses from 34% to 12% of the potable water supplied (refer to columns 10 and 13 of Table 10A on page 175). Refer also to graph 13 on page 208 and figure 34 on page 112.
  4. For general notes see page 32.

Figure 29: Non Revenue Water (L/service connection/d) - water supply

**Parameter:**  $\frac{[\text{Real \& apparent water losses (WB69) + Unbilled water supplied (WB61)}] \times 100}{\text{No. of service connections (WB30)}}$

- Notes:**
1. This figure shows ranked values of the 2014-15 non revenue water for each Local Water Utility (LWU) in 4 groups based on the number of connected properties served – over 10,000, 3,001 to 10,000, 1,501 to 3,000 and 200 to 1,500. Each white bar represents one LWU. As an example, for the second graph (property range from 3,001 to 10,000), the non revenue water for the 28 LWUs shown ranges from 40 to 510 L/service connection/d of the potable supply. Results for the previous 5 years are also shown.
  2. The Statewide median non-revenue water is 94 L/service connection/d.
  3. Refer also to Table 8A on page 159 and Table 10 on page 172.
  4. For general notes see page 32.

Figure 30: Energy consumption per ML - water supply

- Notes:
- 1. This figure shows ranked values of the 2014-15 total energy consumption per ML. The energy consumption per ML for the 85 Local Water Utilities (LWUs) shown range from about 14 to 1400kWh per ML. Results for the previous 2 years are also shown.
  - 2. For general notes see page 32.

Figure 31: Energy consumption per property - water supply

- Notes:
- 1. This figure shows ranked values of the 2014-15 total energy consumption per connected property. The energy usage per connected property for the 83 Local Water Utilities (LWUs) shown range from 4 to 1410kWh per connected property. Results for the previous 2 years are also shown.
  - 2. For general notes see page 32.

Figure 32: Economic real rate of return - water supply - F17

**Parameter:** 
$$\frac{[\text{Operating result (W}_{15}) + \text{interest expense (W}_{4a}) - \text{interest income (W}_{9}) - \text{grants for acquisition of assets (W}_{11a})] \times 100}{\text{Written down replacement cost of system assets, plant \& equipment (W}_{33})}$$

**Notes:**

1. This figure shows ranked values of the 2014-15 water supply economic real rate of return (ERRR) for each Local Water Utility (LWU) in 4 groups based on the number of connected properties served – over 10,000, 3,001 to 10,000, 1,501 to 3,000 and 200 to 1,500. Each white bar represents one LWU. As an example, for the second graph (property range from 3,001 to 10,000), the 2014-15 water supply real rate of return for the 28 LWUs shown ranges from 5% to -2%. Results for the previous 5 years are also shown.
2. The statewide median water supply ERRR is 1.6% [National Median is 1.9%]. Refer also to page 26, Table 5 on page 116, Table 6 on page 134 and figure 43 on page 111.
3. The ERRR includes developer provided assets and capital contributions from other LWUs.
4. For general notes see page 32.

**Figure 33: Operating cost (OMA) per property - water supply - F11**

**Parameter:**  $\frac{\text{Management Expenses (W\_1)} + \text{Total Operations Expenses (W\_2)} - \text{Purchase of Water} + \text{prorata Bulk Supplier's OMA}}{[\text{No. of Residential Assessments (WB32)} + \text{No. of Non-Residential Assessments (WB33)}] \times \text{No. of Connected Properties per Assessment}}$

[No. of Residential Assessments (WB32) + No. of Non-Residential Assessments (WB33)] x No. of Connected Properties per Assessment

**Notes:**

1. This figure shows ranked values of the 2014-15 water supply operating cost (OMA - operation, maintenance and administration) per property for each Local Water Utility (LWU) in 4 groups based on the number of connected properties served – over 10,000, 3,001 to 10,000, 1,501 to 3,000 and 200 to 1,500. Each white bar represents one LWU. As an example, for the second graph (property range from 3,001 to 10,000), the 2014-15 water supply operating costs for the 28 LWUs shown ranges from \$254 to \$746 per connected property. Results for the previous 5 years are also shown in Jan 2015\$.
2. The Statewide median operating cost per connected property is \$400 [National Median is \$455]. Refer also to page 27, Table 5 on page 116, Table 11 on page 180, Table 13 on page 186, graph 25 on page 211, figure 49 on page 112 and pages 21 and 23.
3. For general notes see page 32.

**Figure 34: Operating cost (OMA) per 100km of main - water supply**

**Parameter:**  $\frac{\text{Water Main Operation Expenses (W\_2c) + Water Main Maintenance Costs (W\_2d)}}{\text{Length of Distribution and Reticulation Mains (WB22) x 100}}$

**Notes:**

1. This figure shows ranked values of the 2014-15 water supply operating cost (OMA - operation, maintenance and administration) per 100 km of main for each Local Water Utility (LWU) in 4 groups based on the number of connected properties served – over 10,000, 3,001 to 10,000, 1,501 to 3,000 and 200 to 1,500. Each white bar represents one LWU. As an example, for the second graph (property range from 3,001 to 10,000), the 2014-15 operating costs for the 28 LWUs shown ranges from \$0.56M to \$3.02M per 100km of distribution and reticulation mains (excludes source transfer mains). Results for the previous 5 years are also shown in Jan 2015\$.
2. The Statewide median operating cost is \$1.32M per 100km of water main. Refer also to Table 11 on page 180 and Table 13 on page 186.
3. For general notes see page 32.

Figure 35: Operating cost (OMA) per kL - water supply

**Parameter:**  $\frac{\text{Management Expenses (W}_1\text{)} + \text{Total Operations Expenses (W}_2\text{)} - \text{Purchase of Water (W}_{2o}\text{)}}{\text{Total Potable Water Supplied (WB62)}}$

**Notes:**

1. This figure shows ranked values of the 2014-15 water supply operating cost (OMA - operation, maintenance and administration) per kL for each Local Water Utility (LWU) in 4 groups based on the number of connected properties served – over 10,000, 3,001 to 10,000, 1,501 to 3,000 and 200 to 1,500. Each white bar represents one LWU. As an example, for the second graph (property range from 3,001 to 10,000), the 2014-15 operating costs per kL for the 28 LWUs shown ranges from 59 to 254 c/kL. Results for the previous 5 years are also shown in Jan 2015\$.
2. The Statewide median operating cost is 129c/kL. Refer also to Table 6 on page 134.
3. For general notes see page 32.

**Figure 36: Management cost per property - water supply****Parameter:**

Administration Cost (W\_1a) + Engineering Cost (W\_1b)

$$[\text{No. of Residential Assessments (WB32)} + \text{No. of Non-Residential Assessments (WB33)}] \times \text{No. of Connected Properties per Assessment}$$
**Notes:**

1. This figure shows ranked values of the 2014-15 water supply management cost per property for each Local Water Utility (LWU) in 4 groups based on the number of connected properties served – over 10,000, 3,001 to 10,000, 1,501 to 3,000 and 200 to 1,500. Each white bar represents one LWU. As an example, for the second graph (property range from 3,001 to 10,000), the 2014-15 management costs per property for the 28 LWUs shown range from \$56 to \$297. Results for the previous 5 years are also shown in Jan 2015\$.
2. The Statewide median management cost is \$141 per connected property. Refer also to page 27, Table 11 on page 180 and figure 31 on page 112.
3. For general notes see page 32.

**Figure 37: Treatment cost per property - water supply**

**Parameter:**  $\frac{\text{Treatment Operation Expenses (W\_2j)} + \text{Treatment Chemical Cost (W\_2k)} + \text{Treatment Maintenance Expenses (W\_2l)}}{[\text{No. of Residential Assessments (WB32)} + \text{No. of Non-Residential Assessments (WB33)}] \times \text{No. of Connected Properties per Assessment}}$

**Notes:**

1. This figure shows ranked values of the 2014-15 water treatment cost for each Local Water Utility (LWU) in 4 groups based on the number of connected properties served – over 10,000, 3,001 to 10,000, 1,501 to 3,000 and 200 to 1,500. Each white bar represents one LWU. As an example, for the second graph (property range from 3,001 to 10,000), the 2014-15 treatment costs for the 24 LWUs shown range from \$0 to \$300 per connected property. Results for the previous 5 years are also shown in Jan 2015\$.
2. Only LWUs with a water treatment works involving at least filtration and disinfection for over 50% of their supply have been shown.
3. The Statewide median water treatment cost is \$58 per connected property. Refer also to pages 21, 23, 27 and Table 13 on page 186.
4. For general notes see page 32.

**Figure 38: Pumping cost per property - water supply**

**Parameter:** Pumping Station Operation Expenses (W\_2g) + Pumping Station Energy Cost (W\_2h) + Pumping Station Maintenance Costs (W\_2i)

[No. of Residential Assessments (WB32) + No. of Non-Residential Assessments (WB33)] x No. of Connected Properties per Assessment

**Notes:**

1. This figure shows ranked values of the 2014-15 water pumping cost for each Local Water Utility (LWU) in 4 groups based on the number of connected properties served – over 10,000, 3,001 to 10,000, 1,501 to 3,000 and 200 to 1,500. Each white bar represents one LWU. As an example, for the second graph (property range from 3,001 to 10,000), the 2014-15 water pumping costs for the 28 LWUs shown ranges from \$2 to \$159 per connected property. Results for the previous 5 years are also shown in Jan 2015\$.
2. The Statewide median water pumping cost (including energy costs) is \$31 per connected property. Refer also to page 27 and Table 13 on page 186.
3. For general notes see page 32.

Figure 39: Water main cost per property - water supply

Parameter: Water main operation expenses (W\_2c) + water main maintenance costs (W\_2d)

[No. of residential assessments (WB32) + No. of non-residential assessments (WB33)] x No. of connected properties per assessment

#### Notes:

1. This figure shows ranked values of the 2014-15 water main operating cost for each Local Water Utility (LWU) in 4 groups based on the number of connected properties served – over 10,000, 3,001 to 10,000, 1,501 to 3,000 and 200 to 1,500. Each white bar represents one LWU. As an example, for the second graph (property range from 3,001 to 10,000), the 2014-15 water main costs for the 28 LWUs shown ranges from \$13 to \$169 per property. Results for the previous 5 years are also shown in Jan 2015\$.
2. The Statewide median water main cost is \$74 per property. Refer also to page 27 and Table 13 on page 186.
3. For general notes see page 32.

9. SEWERAGE FIGURES

Figure 40: Properties served per km of main, length of mains - sewerage - A5

Parameter: 
$$\frac{[\text{No. of Residential Assessments (SB13)} + \text{No. of Non-Residential Assessments (SB14)}] \times \text{No. of Connected Properties per Assessment}}{\text{Length of Reticulation/Gravity Mains (SB7)} + \text{Length of Rising Mains (SB8)}}$$

- Note:
- 1. The top graph shows the ranked values of number of connected properties per km of sewerage main for each Local Water Utility (LWU). Each bar represents one LWU. The bottom graph of this figure shows the total length of mains for the corresponding LWUs.
  - 2. The Statewide median sewerage connected properties per km of main is 38 [National Median is 40 per km of main]. Refer also to Table 14 on page 189 and graph 2 on page 205.
  - 3. For general notes see page 32.

Figure 41: Employees - sewerage

**Parameter:**

Full-time Equivalent Employees (SB49) x 1000

[No. of Residential Assessments (SB13) + No. of Non-Residential Assessments (SB14)] x No. of Connected Properties per Assessment

**Notes:**

1. This figure shows ranked values of the 2014-15 sewerage employees for each Local Water Utility (LWU) in 4 groups based on the number of connected properties served – over 10,000, 3,001 to 10,000, 1,501 to 3,000 and 200 to 1,500. Each white bar represents one LWU. As an example, for the second graph (property range from 3,001 to 10,000), the 2014-15 sewerage employees for the 26 LWUs shown ranges from about 1 to 3 per 1,000 connected properties. Results for the previous 5 years are also shown.
2. The 2014-15 Statewide median number of sewerage employees is 1.6 per 1,000 connected properties. Refer also to pages 21, 23, 27 and Table 14 on page 189.
3. For general notes see page 32.

Figure 42: Typical residential bill – sewerage - P6

Parameter: Residential Access Charge

#### Notes:

1. This figure shows ranked values of the 2015-16 typical residential bill for sewerage for each Local Water Utility (LWU) in 4 groups based on the number of connected properties served – over 10,000, 3,001 to 10,000, 1,501 to 3,000 and 200 to 1,500. Each white bar represents one LWU. As an example, for the second graph (property range from 3,001 to 10,000), the 2015-16 typical residential bill for sewerage for the 27 LWUs shown ranges from about \$379 to \$930.
2. The 2015-16 Statewide median typical residential bill for sewerage is \$697 per assessment [National Median for 2014-15 is \$667 per assessment]. Refer also to Table 5 on page 116, Table 7 on page 146, graph 6 on page 206 and figure 12 on page 113.
3. For general notes see page 32.

Figure 43: Typical developer charge - sewerage

**Parameter:** Typical Sewerage Developer Charge (SB62)

**Notes:**

1. This figure shows ranked values of the 2015-16 typical developer charge for sewerage for each Local Water Utility (LWU) in 4 groups based on the number of connected properties served – over 10,000, 3,001 to 10,000, 1,501 to 3,000 and 200 to 1,500. Each white bar represents one LWU. As an example, for the second graph (property range from 3,001 to 10,000), the typical developer charge for sewerage for the 26 LWUs shown ranges from \$9,500 to \$1,600 per equivalent tenement (ET).
2. The 2015-16 Statewide median typical sewerage developer charge was \$5,100 per ET, which is 31% of the current replacement cost of sewerage system assets of \$16,500 per assessment. Refer also to Table 7 on page 146.
3. 90 LWUs levied sewerage developer charges.
4. For general notes see page 32.

**Figure 44: Non-residential sewer usage charge - sewerage**

**Parameter:** Non-residential sewer usage charge (c/kL)

**Notes:**

1. This figure shows ranked values of the 2015-16 non-residential sewer usage charge for each Local Water Utility (LWU) in 4 groups based on the number of connected properties served – over 10,000, 3,001 to 10,000, 1,501 to 3,000 and 200 to 1,500. Each white bar represents one LWU. As an example, for the second graph (property range from 3,001 to 10,000), the non-residential sewer usage charge for the 26 LWUs shown ranges from 331 to 75c/kL. 7 utilities do not have a sewer usage charge.
2. The 2015-16 Statewide median non-residential sewer usage charge was 150.0c/kL. Refer also to Table 7 on page 146 and figure 14 on page 113.
3. For general notes see page 32.

Figure 45: Trade waste usage charge - sewerage

**Parameter:** Trade waste usage charge (c/kL)

**Notes:**

1. This figure shows ranked values of the 2015-16 trade waste usage charge for each Local Water Utility (LWU) in 4 groups based on the number of connected properties served – over 10,000, 3,001 to 10,000, 1,501 to 3,000 and 200 to 1,500. Each white bar represents one LWU. As an example, for the second graph (property range from 3,001 to 10,000), the trade waste usage charge for the 27 LWUs shown ranges from 206 to 70c/kL. 5 utilities do not have a trade waste usage charge.
2. Refer also to Table 7 on page 146 and Table 7C on page 153.
3. For general notes see page 32.

Figure 46: Sewerage coverage

Parameter: Population served (SB1)  
Population served (SB1) + unserved urban population (SB21)

- Notes:
1. This figure shows ranked values of the sewerage coverage for the urban population for each Local Water Utility (LWU) in 4 groups based on the number of connected properties served – over 10,000, 3,001 to 10,000, 1,501 to 3,000 and 200 to 1,500. Each white bar represents one LWU. As an example, for the second graph (property range from 3,001 to 10,000), the sewerage coverage for the 27 LWUs shown ranges from 99.8% to 83%. Results for the previous 5 years are also shown.
  2. The 2014-15 Statewide median sewerage coverage was 97.9%.
  3. The sewerage coverage for the median LWU was 94%.
  4. The overall sewerage coverage for regional NSW was 96.3% of the urban population (ie. 1.74 million people). The systematic provision of backlog sewerage services for unsewered small towns under the NSW Government's Country Towns Water Supply and Sewerage Program has increased the sewerage coverage to 96.3% of the urban population, compared to 92.3% in 1996.
  5. For general notes see page 32.

Figure 47: Public health incidents, capital expenditure - sewerage

**Parameter:** Total No. of minor incidents with inconsequential effects (SB44)  
[No. of residential assessments (SB13) + No. of non-residential assessments (SB14)] x No. of connected properties per assessment

**Parameter:** Total No. of minor incidents with limited health impacts (SB45)  
[No. of residential assessments (SB13) + No. of non-residential assessments (SB14)] x No. of connected properties per assessment

**Parameter:** Total No. of major incidents with major health impacts (SB46)  
[No. of residential assessments (SB13) + No. of non-residential assessments (SB14)] x No. of connected properties per assessment

**Parameter:** Capital expenditure on improving health performance (\$) x (SB48)  
[No. of residential assessments (SB13) + No. of non-residential assessments (SB14)] x No. of connected properties per assessment

- Notes:**
- 1. Lachlan, Richmond Valley, Wyong, Gundagai and Murrumbidgee did not report public health incidents. 30 Utilities reported incidents and are shown in the figure above, while 64 utilities reported zero health incidents.
  - 2. For general notes see page 32.

Figure 48: Complaints (per 1000 properties) - sewerage

Parameter: 
$$\frac{[\text{Total no. of complaints (SB34) + (SB37) + (SB38) + (SB39)] \times 1000}{[\text{No. of residential assessments (SB13) + No. of non-residential assessments (SB14)] \times \text{No. of connected properties per assessment}}$$

Note: 1. For general notes see page 32. Refer also to Table 17 on page 198.

Figure 49: Odour complaints - sewerage

**Parameter:** [No. of Odour Complaints from Treatment Works and Pumping Stations (SB39) x 1000  
[No. of Residential Assessments (SB13) + No. of Non-Residential Assessments (SB14)] x No. of Connected Properties per Assessment

- Notes:**
1. This figure shows ranked values of the 2014-15 number of sewage odour complaints for each Local Water Utility (LWU) in 4 groups based on the number of connected properties served – over 10,000, 3,001 to 10,000, 1,501 to 3,000 and 200 to 1,500. Each white bar represents one LWU. As an example, for the second graph (property range from 3,001 to 10,000), the number of odour complaints for the 27 LWUs shown ranges from 0 to 5 complaints per thousand connected properties. Results for the previous 5 years are also shown.
  2. This is a very important indicator for residents if the 'utility gets it wrong' and there are widespread sewage odour complaints in its area. The above results indicate that this has not been the case in regional NSW, where over the last 6 years, odour complaints have rarely exceeded 5 per thousand connected properties.
  3. The 2014-15 Statewide median number of odour complaints is 0.8 per 1000 properties. Refer also to Table 17 on page 198, graph 11 on page 207 and figure 21 on page 114.
  4. For general notes see page 32.

**Figure 50: Compliance with BOD in licence - sewerage**

**Parameter:** Percentage of samples complying with 90 percentile Environment Protection Authority (EPA) licence limits for Biochemical Oxygen Demand (BOD) (ST50)

**Note:**

1. Refer also to Table 17 on page 198 and graph 18 on page 209.
2. For general notes see page 32.

**Figure 51: Compliance with SS in licence - sewerage**

**Parameter:** Percentage of samples complying with 90 percentile Environment Protection Authority (EPA) licence limits for Suspended Solids (SS) (ST52)

**Note:**

1. Refer also to Table 17 on page 198 and graph 18 on page 209.
2. For general notes see page 32.

**Figure 52: Compliance with N in licence - sewerage**

**Parameter:** Percentage of samples complying with 90 percentile Environment Protection Authority (EPA) licence limits for Total Nitrogen (ST54)

**Note:**

1. Refer also to Table 17 on page 198.
2. For general notes see page 32.

Figure 53: Compliance with P in licence - sewerage

**Parameter:** Percentage of samples complying with 90 percentile Environment Protection Authority (EPA) licence limits for Total Phosphorus (ST60)

**Note:**

1. Refer also to Table 17 on page 198.
2. For general notes see page 32.

Figure 54: Percent of sewage volume treated that was compliant - sewerage - E4

**Parameter:**  $\frac{(\text{No. of scheduled samples complying with all of the licence limits}) \times 100}{\text{Total No. of scheduled samples in reporting period}}$

**Note:**

1. Refer also to Table 17 on page 198, graph 21 on page 210 and figure 18 on page 113.
2. For general notes see page 32.

Figure 55: Sewerage main breaks and chokes - sewerage - A14

**Parameter:**  $\frac{\text{Total No. of Sewerage Main Breaks and Chokes [(SB64) + (SB65)] \times 100}{\text{Length of Reticulation/Gravity Mains (SB7) + Length of Rising Mains (SB8)}}$

- Notes:**
1. This figure shows ranked values of the 2014-15 sewerage main breaks and chokes for each Local Water Utility (LWU) in 4 groups based on the number of connected properties served – over 10,000, 3,001 to 10,000, 1,501 to 3,000 and 200 to 1,500. Each white bar represents one LWU. As an example, for the second graph (property range from 3,001 to 10,000), the 2014-15 sewerage main breaks and chokes for the 26 LWUs shown ranges from 5 to 157 chokes per 100 km of sewer mains. Results for the previous 5 years are also shown.
  2. Note NWI Indicator A14 (sewerage main breaks and chokes) was revised in 2009/10 to exclude property connection sewer breaks and chokes which were previously included in this indicator. The results shown for 2008/09 are based on the previous definition which includes property connections sewer breaks and chokes.
  3. The Statewide median sewerage main breaks and chokes is 36 per 100 km of sewer mains, which is significantly higher than the National Median of 17. The NSW median has fallen from 75 to 36 over the past 23 years, partly as a result of revision of the national definition for this indicator in 2009-10. Refer also to Table 5 on page 116, Table 15 on page 192, graph 20 on page 210 and figure 36 on page 113.
  4. For general notes see page 32.

Figure 56: Sewer overflows reported to environmental regulator - sewerage - E13

**Parameter:**  $\frac{\text{Total No. of Sewage Overflows Reported to Regulator (SB63b)} \times 100}{\text{Length of Reticulation/Gravity Mains (SB7) + Length of Rising Mains (SB8)}}$

**Notes:**

1. This figure shows ranked values of the 2014-15 overflows reported to the environmental regulator for each Local Water Utility (LWU) in 4 groups based on the number of connected properties served – over 10,000, 3,001 to 10,000, 1,501 to 3,000 and 200 to 1,500. Each white bar represents one LWU. As an example, for the second graph (property range from 3,001 to 10,000), the 2014-15 overflows reported to the environmental regulator for the 24 LWUs shown ranges from nil to 7 overflows per 100 km of sewer mains. The 3 utilities on the right did not report this indicator for 2014-15. Results for the previous 5 years are also shown.
2. The Statewide median sewer overflows reported to the environmental regulator is 0.9 per 100 km of sewer mains [National Median is 0.5 per 100 km of sewer mains]. Refer also to Table 15 on page 192, graph 23 on page 210 and figure 37b on page 113.
3. 54% of reporting LWUs had no sewer overflows reported to the environmental regulator.
4. For general notes see page 32.

Figure 57: Recycled water (% of effluent recycled) - sewerage - W27

Parameter:

Total Volume Recycled (WB158) x 100  
Volume of Sewage Treated (Secondary Treatment) (STT18)

## Notes:

1. This figure shows ranked values of the 2014-15 recycled water (% of sewage effluent recycled) for each Local Water Utility (LWU) in 4 groups based on the number of connected properties served – over 10,000, 3,001 to 10,000, 1,501 to 3,000 and 200 to 1,500. Each white bar represents one LWU. As an example, for the second graph (property range from 3,001 to 10,000), the 2014-15 recycled water (% of sewage effluent recycled) for the 27 LWUs shown ranges from 96% to 0%.
2. The 2013-14 result has been adopted for any LWUs that did not report historically consistent effluent reuse (generally >25%). These LWUs are shown in *italics bold* in Table 15 on page 192 and Table 5 on page 116.
3. The Statewide median reuse of recycled water is 10% of effluent recycled.
4. The total volume of recycled water for regional NSW was 39,000 ML, which was 22% of the total volume of sewage collected [National Median is 15%]. Re-use was carried out by 70% of LWUs. 20% of LWUs recycled over 50% of their effluent.
5. Refer also to Table 5 on page 116, Table 15 on page 192, graph 16 on page 209, figure 27 on page 114 and to pages 10 and 19 of the 2014-15 NSW Water Supply and Sewerage Performance Monitoring Report ([www.water.nsw.gov.au](http://www.water.nsw.gov.au)).
6. For general notes see page 32.

Figure 58: Energy consumption per ML - sewerage

Parameter:  $\frac{\text{Total Energy Usage (SB79) } \times 1000}{\text{Total Volume of Sewage Collected (ST15)}}$

2012-13 2013-14 2014-15

- Notes:
- 1. This figure shows ranked values of the 2014-15 total energy consumption per ML. The energy consumption per ML for the 90 Local Water Utilities (LWUs) shown range from about 15 to 2500 kWh per connected property. Results for the previous 2 years are also shown.
  - 2. For general notes see page 32.

Figure 59: Energy consumption per property - sewerage

Parameter:  $\frac{\text{Total Energy Usage (SB79) } \times 1000}{[\text{No. of Residential Assessments (SB13) } + \text{No. of Non-Residential Assessments (SB14)}] \times \text{No. of Connected Properties per Assessment}}$

2012-13 2013-14 2014-15

- Notes:
- 1. This figure shows ranked values of the 2014-15 total energy consumption per connected property. The energy usage per connected property for the 91 Local Water Utilities (LWUs) shown range from about 5 to 440 kWh per connected property. Results for the previous 2 years are also shown.
  - 2. For general notes see page 32.

**Figure 60: Environmental incidents, management systems, capital investment - sewerage**

|                   |  |
|-------------------|--|
| <b>Parameter:</b> | <u>Total number of minor incidents with inconsequential effects (SB69)</u>   |
|                   | [No. of residential assessments (SB13) + No. of non-residential assessments (SB14)] x No. of connected properties per assessment |
| <b>Parameter:</b> | <u>Total number of incidents with limited enviromental impacts (SB70)</u>  |
|                   | [No. of residential assessments (SB13) + No. of non-residential assessments (SB14)] x No. of connected properties per assessment |
| <b>Parameter:</b> | <u>Total number of incidents with irreversible enviromental impacts (SB71)</u>   |
|                   | [No. of residential assessments (SB13) + No. of non-residential assessments (SB14)] x No. of connected properties per assessment |
| <b>Parameter:</b> | <u>Capital expenditure on improving environmental performance (\$) (SB76)</u>  |
|                   | [No. of residential assessments (SB13) + No. of non-residential assessments (SB14)] x No. of connected properties per assessment |

**Notes:**

1. The following 4 utilities did not report for environmental incidents: Lachlan, Richmond Valley, Gundagai and Murrumbidgee. 40 utilities reported and are shown in the figure above, while 56 utilities reported zero environmental incidents.
2. The following 52 LWUs have prepared a sewerage Environmental Management Plan:  
Ballina, Balranald, Bathurst, Bellingen, Berrigan, Blayney, Bogan, Bombala, Brewarrina, Byron, Cabonne, Carrathool, Coffs Harbour, Coonamble, Corowa, Dubbo, Glen Innes Severn, Gosford, Greater Hume, Gunnedah, Guyra, Junee, Kempsey, Kyogle, Lachlan, Leeton, Lismore, Liverpool Plains, MidCoast, Moree Plains, Murray, Murrumbidgee, Muswellbrook, Narrabri, Narrandera, Narromine, Oberon, Parkes, Queanbeyan, Shoalhaven, Sydney Water, Tamworth, Temora, Tumbarumba, Tweed, Upper Hunter, Uralla, Wagga Wagga, Wakool, Walcha, Walgett, Weddin.
3. For general notes see page 32.

Figure 61: Economic real rate of return - sewerage - F18

**Parameter:** 
$$\frac{[\text{Operating Result (S}_{16}\text{)} + \text{Interest Expense (S}_{4a}\text{)} - \text{Interest Income (S}_{10}\text{)} - \text{Grants for Acquisition of Assets (S}_{12a}\text{)}] \times 100}{\text{Written Down Replacement Cost of System Assets, Plant \& Equipment (S}_{34}\text{)}}$$

**Notes:**

1. This figure shows ranked values of the 2014-15 sewerage economic real rate of return (ERRR) for each Local Water Utility (LWU) in 4 groups based on the number of connected properties served – over 10,000, 3,001 to 10,000, 1,501 to 3,000 and 200 to 1,500. Each white bar represents one LWU. As an example, for the second graph (property range from 3,001 to 10,000), the 2014-15 sewerage real rate of return for the 26 LWUs shown ranges from 4.9% to -0.6%. Results for the previous 5 years are also shown.
2. The Statewide median sewerage ERRR is 1.7% [National Median is 3%]. Refer also to page 26, Table 5 on page 116, Table 7 on page 146 and figure 46 on page 113.
3. The ERRR includes developer provided assets and capital contributions from other LWUs.
4. For general notes see page 32.

Figure 62: Operating cost (OMA) per property - sewerage - F12

**Parameter:**  $\frac{\text{Management Expenses (S}_1\text{)} + \text{Total Operations Expenses (S}_2\text{)} - \text{Purchase of Water} + \text{Bulk Supplier's OMA}}{[\text{No. of residential assessments (SB13)} + \text{No. of non-residential assessments (SB14)}] \times \text{No. of connected properties per assessment}}$

[No. of residential assessments (SB13) + No. of non-residential assessments (SB14)] x No. of connected properties per assessment

#### Notes:

1. This figure shows ranked values of the 2014-15 water supply operating cost (OMA - operation, maintenance and administration) per property for each Local Water Utility (LWU) in 4 groups based on the number of connected properties served – over 10,000, 3,001 to 10,000, 1,501 to 3,000 and 200 to 1,500. Each white bar represents one LWU. As an example, for the second graph (property range from 3,001 to 10,000), the operating costs for the 27 LWUs shown ranges from \$227 to \$630 per connected property. Results for the previous 5 years are also shown.
2. The Statewide median operating cost per connected property is \$420 [National Median is \$400]. Refer also to Table 5 on page 116, Table 16 on page 195, graph 26 on page 211, figure 50 on page 115 and pages 21, 23 and 27.
3. For general notes see page 32.

**Figure 63: Operating cost (OMA) per 100 km of main - sewerage**

**Parameter:**  $\frac{\text{Management Expenses (S\_1) + Total Operations and Maintenance Expenses (S\_2)}}{[\text{Length of Reticulation Mains (SB7) + Length of Rising Mains (SB8)] \times 10}$

**Notes:**

1. This figure shows ranked values of the 2014-15 sewerage operating cost (OMA - operation, maintenance and administration) per 100 km of main for each Local Water Utility (LWU) in 4 groups based on the number of connected properties served – over 10,000, 3,001 to 10,000, 1,501 to 3,000 and 200 to 1,500. Each white bar represents one LWU. As an example, for the second graph (property range from 3,001 to 10,000), the sewerage operating costs for the 27 LWUs shown ranges from \$0.81M to \$2.6M per 100 km of sewer main. Results for the previous 5 years are also shown.
2. The Statewide median operating cost is \$1.72M per 100 km of sewer main. Refer also to Table 16 on page 195 and Table 18 on page 201.
3. For general notes see page 32.

Figure 64: Operating cost (OMA) per kL - sewerage

Parameter: Management Expenses (S\_1) + Total Operations and Maintenance Expenses (S\_2)

Volume of Sewage Treated (Secondary Treatment) (ST18) x 10

#### Notes:

1. This figure shows ranked values of the 2014-15 sewerage operating cost (OMA - operation, maintenance and administration) per 100 km of main for each Local Water Utility (LWU) in 4 groups based on the number of connected properties served – over 10,000, 3,001 to 10,000, 1,501 to 3,000 and 200 to 1,500. Each white bar represents one LWU. As an example, for the second graph (property range from 3,001 to 10,000), the sewerage operating costs for the 27 LWUs shown range from 87c/kL to 339c/kL. Results for the previous 5 years are also shown.
2. The Statewide median operating cost is 194c/kL. Refer also to Table 7 on page 146.
3. For general notes see page 32.

Figure 65: Management cost per property - sewerage

Parameter: Administration cost (S\_1a) + engineering cost (S\_1b)

[No. of residential assessments (SB13) + No. of non-residential assessments (SB14)] x No. of connected properties per assessment

#### Notes:

1. This figure shows ranked values of the 2014-15 water supply management cost per property for each Local Water Utility (LWU) in 4 groups based on the number of connected properties served – over 10,000, 3,001 to 10,000, 1,501 to 3,000 and 200 to 1,500. Each white bar represents one LWU. As an example, for the second graph (property range from 3,001 to 10,000), the 2014-15 management costs for the 26 LWUs shown ranges from \$57 to \$310. Results for the previous 5 years are also shown.
2. The Statewide median management cost is \$160 per connected property. Refer also to page 27 and Table 16 on page 195.
3. For general notes see page 32.

Figure 66: Treatment cost - sewerage

**Parameter:**  $\frac{\text{Treatment Operation Expenses (S\_2f)} + \text{Treatment Chemical Cost (S\_2g)} + \text{Energy Cost (S\_2h)} + \text{Treatment Maintenance Expenses (S\_2k)}}{[\text{No. of residential assessments (SB13)} + \text{No. of non-residential assessments (SB14)}] \times \text{No. of connected properties per assessment}}$

**Notes:**

1. This figure shows ranked values of the 2014-15 sewerage treatment cost for each Local Water Utility (LWU) in 4 groups based on the number of connected properties served – over 10,000, 3,001 to 10,000, 1,501 to 3,000 and 200 to 1,500. Each white bar represents one LWU. As an example, for the second graph (property range from 3,001 to 10,000), the 2014-15 sewerage treatment cost for the 27 LWUs shown ranges from \$50 to \$300 per connected property. Results for the previous 5 years are also shown.
2. The Statewide median sewage treatment cost is \$145 per connected property. Refer also to pages 21, 23, 27 and Table 18 on page 201.
3. For general notes see page 32.

Figure 67: Pumping cost - sewerage

**Parameter:** Pumping station operation expenses (S\_2c) + energy cost (S\_2d) + treatment cost (S\_2e)

[No. of residential assessments (SB13) + No. of non-residential assessments (SB14)] x No. of connected properties per assessment

#### Notes:

1. This figure shows ranked values of the 2014-15 sewerage pumping cost for each Local Water Utility (LWU) in 4 groups based on the number of connected properties served – over 10,000, 3,001 to 10,000, 1,501 to 3,000 and 200 to 1,500. Each white bar represents one LWU. As an example, for the second graph (property range from 3,001 to 10,000), the 2014-15 sewerage pumping cost for the 26 LWUs shown ranges from \$0 to \$116 per connected property. Results for the previous 5 years are also shown.
2. The Statewide median pumping cost is \$72 per connected property. Refer also to page 27 and Table 18 on page 201.
3. For general notes see page 32.

Figure 68: Sewer main cost - sewerage

**Parameter:** Sewer main operation cost (S\_2a) + sewer main maintenance cost (S\_2b)

[No. of residential assessments (SB13) + No. of non-residential assessments (SB14)] x No. of connected properties per assessment

**Notes:**

1. This figure shows ranked values of the 2014-15 sewer main cost for each Local Water Utility (LWU) in 4 groups based on the number of connected properties served – over 10,000, 3,001 to 10,000, 1,501 to 3,000 and 200 to 1,500. Each white bar represents one LWU. As an example, for the second graph (property range from 3,001 to 10,000), the 2014-15 sewer main cost for the 27 LWUs shown ranges from \$13 to \$143 per connected property. Results for the previous 5 years are also shown.
2. The Statewide median sewer main cost is \$51 per connected property. Refer also to page 27 and Table 18 on page 201.
3. For general notes see page 32.

Notes:

1. The above NSW performance indicators are Statewide Percentiles which are calculated on a percentage of connected properties basis as this best reveals statewide performance by giving due weight to larger LWUs and reducing the effect of smaller LWUs.
2. 20% is the top 20% of properties, Median (50%) is the median of properties (Statewide) and 80% is the bottom 20% of properties.
3. To compare the performance of one LWU with other LWUs, the calculation of percentiles on a percentage of LWUs basis is the most appropriate. Percentiles (on a percentage of LWUs basis) are shown on the Table on page 278 of Appendix C.
4. National Medians are from the National Performance Report 2014-15 which shows the performance indicators for 76 Australian urban water utilities providing reticulated water supply services to >10,000 properties [Note 14 on page 34]. The 7 bulk supply utilities are excluded.

**Notes:**

1. The above NSW performance indicators are Statewide Percentiles which are calculated on a percentage of connected properties basis as this best reveals statewide performance by giving due weight to larger LWUs and reducing the effect of smaller LWUs.
2. 20% is the top 20% of properties, Median (50%) is the median of properties (Statewide) and 80% is the bottom 20% of properties.
3. To compare the performance of one LWU with other LWUs, the calculation of percentiles on a percentage of LWUs basis is the most appropriate. Percentiles (on a percentage of LWUs basis) are shown on the Table on page 279 of Appendix C.
4. National Medians are from the National Performance Report 2014-15 which shows the performance indicators for 75 Australian urban water utilities providing reticulated sewerage services to >10,000 connected properties [Note 14 on page 34].

- Notes**
1. The above NSW performance indicators are Statewide Percentiles which are calculated on a percentage of connected properties basis as this best reveals statewide performance by giving due weight to larger LWUs and reducing the effect of smaller LWUs.
  2. 20% is the top 20% of properties, Median (50%) is the median of properties (Statewide) and 80% is the bottom 20% of properties.
  3. To compare the performance of one LWU with other LWUs, the calculation of percentiles on a percentage of LWUs basis is the most appropriate. Percentiles (on a percentage of LWUs basis) are shown on the Table on pages 278 and 279 of Appendix C.
  4. National Medians are from the National Performance Report 2014-15 which shows the performance indicators for 71 Australian urban water utilities providing reticulated water supply and sewerage services to >10,000 properties [Note 14 on page 34].
  5. Bulk supply utilities and single service utilities are excluded.

Overall Implementation for all WS Businesses 91%

Overall Implementation for all SGE Businesses 89%

- Notes:**
- The Best-Practice Management outcomes which need to be implemented by LWUs are set out in "*Best-Practice Management of Water Supply and Sewerage Guidelines August 2007*" (BPMG).
  - There are 10 outcomes which must be implemented for water supply. These are (1), (2a), (2b), (2c), (2d), (2e), (3), (4), (5) and (6) shown in the table above for water supply.
  - There are 9 outcomes which must be implemented for sewerage. These are (1), (2a), (2b), (2c), (2d), (2e), (2f), (3) and (4) shown in the table above for sewerage.
  - The level of implementation of the 19 planning, pricing and management outcomes of the BPMG shown in the table above is from Notes 2 or 3 of the Special Purpose Financial Statements reported by each LWU in their Annual Financial Statements, supplemented by other data provided to DPI Water by the LWU. Documents which have implemented the required outcomes (including strategic business plans and IWCM evaluations and strategies) provided by LWUs to DPI Water by February 2016 are included in the results reported.
  - As shown above and in Table 8C on page 163, 48 LWUs have completed their 30-year IWCM Strategy (shown as 'YesC' in columns (6) and (4) above) for water supply and sewerage respectively. A further 21 LWUs have completed an IWCM Evaluation, and are shown as 'YesE' above. A further 12 LWUs are currently preparing their IWCM Evaluation and are shown as 'Yes' above. The IWCM Evaluations and Strategies have been reviewed by DPI Water and found to be soundly based. Similarly, the strategic business plans and trade waste policies shown as Yes above have been reviewed by DPI Water and found to be soundly based. However, the water conservation and drought management plans have only been briefly examined to confirm that they address the required issues.
  - The revenue for LWUs with water supply only or sewerage only is shown left justified above. For these LWUs, the relevant revenue to be classified as a "large LWU" is \$5M.
  - For requirement (2c) utilities with 4,000 or more connected properties which obtained 70% to 74% of residential revenue from usage charges are shown as Yes\*. Yes\* is also shown for Wyong and Essential Energy, whose prices are determined by IPART. Yes\*\* is shown for Eurobodalla which received 'deemed compliance' for its usage charge of \$3.48/kL, which is the second highest in NSW. In addition, the Minister has approved replacement of the 75% requirement with 70% for Eurobodalla (due to the high incidence of holiday houses, which are unoccupied for most of the year). Utilities with fewer than 4,000 connected properties serve 10% of the connected properties in regional NSW and are only required to achieve 50% for requirement (2c). Such utilities which have obtained 45% to 49% residential revenue from water usage charges are shown as Yes\*. 30 LWUs (64%) with 4,000 or more properties have met this requirement, as have 40 LWUs (87%) with fewer than 4,000 properties. Bulk water suppliers are not required to meet requirements (2b), (2c) or (2d) which refer to residential water tariffs.
  - Yes\* for requirement (1) indicates that as the strategic business plan and financial plan for these 51 LWUs are now over 4 years old, the LWU needs to prepare a new 30-year IWCM Strategy and financial plan in accordance with the July 2014 IWCM Check List ([www.water.nsw.gov.au](http://www.water.nsw.gov.au)). Similarly, the 17 LWUs whose IWCM Strategy is over 6 years old [shown as Yes\*] need to prepare such a new IWCM Strategy, financial plan and report [column 34 on page 116]. Refer also to pages 4 and 22.
  - Yes\* for requirement (2a) for water supply or for sewerage indicates that the LWU has significantly increased their 2015/16 charges in order to recover their costs.
  - Yes\* for requirement (2e) for water supply or for sewerage indicates that the LWU has commercial developer charges in place but is yet to complete and implement its Development Servicing Plan (DSP). Yes<sup>e</sup> for these requirements indicates the LWU is exempt from the requirement to prepare a DSP due to low growth (under 5 lots/a).
  - Yes\* for requirement (2f) for sewerage indicates that the LWU has adopted a trade waste policy before 2009, which needs significant updating.
  - As shown above, the overall levels of implementation of the outcomes of the Best-Practice Management Guidelines for water supply (for all 10 outcomes) were: 95% for LWUs with >10,000 properties; 93% for LWUs with 3,001 - 10,000 properties; 88% for LWUs with 1,501 - 3,000 properties and 84% for LWUs with 200 - 1,500 properties respectively. The overall level of implementation for water supply for all LWUs was 91%.
  - As shown above, the overall levels of implementation of the outcomes of the Best-Practice Management Guidelines for sewerage (for all 9 outcomes) were: 100% for LWUs with >10,000 properties; 93% for LWUs with 3,001 - 10,000 properties; 87% for LWUs with 1,501 - 3,000 properties and 77% for LWUs with 200 - 1,500 properties respectively. The overall level of implementation for sewerage for all LWUs was 89%.
  - The overall implementation of outcomes for water supply and sewerage was 90%.

Table 4: Trends in statewide performance indicators - 1991 to 2014-15

Water supply

Water supplied

Water supplied / capital expenditure

Cost recovery

Health

**Water Supply Notes:**

1 Costs are in Jan 2015\$.

2 The figure numbers (eg. 33. Average Annual Residential Water Supplied) correspond to the indicator number in the TBL reports and in Table 1 on page 105. Where there is an equivalent NWI indicator (eg. W12), this is shown in the title.

3 The figures show NSW Statewide medians (note 4 on page 32 ie. based on % of connected properties), except for figure 20 which is based on the total number of samples tested, figure 20a which is % of the 1.83m regional NSW population served by a potable water supply, figure 31 which is % of utilities, figure 33d which is total volume of recycled urban water supplied for regional NSW and figures 56, 49 and 49a which pro-rate the breakdown of the median on the basis of each year's expenditure by all LWUs.

4 The National Median for each financial year is the median value of the results published in the National Performance Report for Urban Water Utilities ([www.bom.gov.au](http://www.bom.gov.au)).

**Sewerage Notes:**

1 Costs are in Jan 2015\$ except for figure 14, which is in Jan 2016\$.

2 The figure numbers (eg. 12. Sewerage Typical Residential Bill) correspond to the indicator number in the TBL reports and in Table 2 on page 106. Where there is an equivalent NWI indicator (eg. P6), this is shown in the title.

3 The figures show NSW Statewide medians (note 4 on page 32, ie. based on % of connected properties), except for figures 34 & 35 which are % of samples tested, figure 26a which is the total volume of water recycled in regional NSW, figure 27 which is % of the total volume recycled in regional NSW as a percentage of the total volume of sewage collected and figures 56, 50 and 50a which pro-rate the breakdown of the median on the basis of each year's expenditure by all LWUs.

4 The National Median for each financial year is the median value of the results published in the National Performance Report for Urban Water Utilities ([www.bom.gov.au](http://www.bom.gov.au)).

Water Supply and Sewerage Notes:

- 1 Costs are in Jan 2015\$.
- 2 The figure numbers (eg. 2a Water & Sewerage Typical Residential Bill ) correspond to the indicator number shown in Table 2A on page 107. The equivalent NWI indicator (eg. P8) is shown in the title.
- 3 The figures show NSW Statewide medians (ie. based on % of connected properties).
- 4 The National Median for each financial year is the median value of the results published in the National Performance Report for Urban Water Utilities ([www.bom.gov.au](http://www.bom.gov.au)).

|               |  |  |   |  |                          |     |          |  |   | Achieved?<br><br>Note 12             | % Pop'n with Compliance | Achieved?<br><br>Note 11 | % Pop'n with Compliance |  |  |  |   |   |  |  |   | WS & SGE          | WS & SGE |  |  |                     |     |                              |     |                    |     |                    |     |                              |     |    |     |          |   | WS & SGE | WS & SGE | WS & SGE | WS & SGE | WS & SGE | WS & SGE | WS & SGE | WS & SGE | WS & SGE | WS & SGE | WS & SGE | WS & SGE | WS & SGE | WS & SGE | WS & SGE | WS & SGE | WS & SGE | WS & SGE | WS & SGE | WS & SGE | WS & SGE | WS & SGE | WS & SGE | WS & SGE | WS & SGE | WS & SGE | WS & SGE | WS & SGE | WS & SGE | WS & SGE | WS & SGE | WS & SGE | WS & SGE | WS & SGE | WS & SGE | WS & SGE | WS & SGE | WS & SGE | WS & SGE | WS & SGE | WS & SGE | WS & SGE | WS & SGE | WS & SGE | WS & SGE | WS & SGE | WS & SGE | WS & SGE | WS & SGE | WS & SGE | WS & SGE | WS & SGE | WS & SGE | WS & SGE | WS & SGE | WS & SGE | WS & SGE | WS & SGE | WS & SGE | WS & SGE | WS & SGE | WS & SGE | WS & SGE | WS & SGE | WS & SGE | WS & SGE | WS & SGE | WS & SGE | WS & SGE | WS & SGE | WS & SGE | WS & SGE | WS & SGE | WS & SGE | WS & SGE | WS & SGE | WS & SGE | WS & SGE | WS & SGE | WS & SGE | WS & SGE | WS & SGE | WS & SGE | WS & SGE | WS & SGE | WS & SGE | WS & SGE | WS & SGE | WS & SGE | WS & SGE | WS & SGE | WS & SGE | WS & SGE | WS & SGE | WS & SGE | WS & SGE | WS & SGE | WS & SGE | WS & SGE | WS & SGE | WS & SGE | WS & SGE | WS & SGE | WS & SGE | WS & SGE | WS & SGE | WS & SGE | WS & SGE | WS & SGE | WS & SGE | WS & SGE | WS & SGE | WS & SGE | WS & SGE | WS & SGE | WS & SGE | WS & SGE | WS & SGE | WS & SGE | WS & SGE | WS & SGE | WS & SGE | WS & SGE | WS & SGE | WS & SGE | WS & SGE | WS & SGE | WS & SGE | WS & SGE | WS & SGE | WS & SGE | WS & SGE | WS & SGE | WS & SGE | WS & SGE | WS & SGE | WS & SGE | WS & SGE | WS & SGE | WS & SGE | WS & SGE | WS & SGE | WS & SGE | WS & SGE | WS & SGE | WS & SGE | WS & SGE | WS & SGE | WS & SGE | WS & SGE | WS & SGE | WS & SGE | WS & SGE | WS & SGE | WS & SGE | WS & SGE | WS & SGE | WS & SGE | WS & SGE | WS & SGE | WS & SGE | WS & SGE | WS & SGE | WS & SGE | WS & SGE | WS & SGE | WS & SGE | WS & SGE | WS & SGE | WS & SGE | WS & SGE | WS & SGE | WS & SGE | WS & SGE | WS & SGE | WS & SGE | WS & SGE | WS & SGE | WS & SGE | WS & SGE | WS & SGE | WS & SGE | WS & SGE | WS & SGE | WS & SGE | WS & SGE | WS & SGE | WS & SGE | WS & SGE | WS & SGE | WS & SGE | WS & SGE | WS & SGE | WS & SGE | WS & SGE | WS & SGE | WS & SGE | WS & SGE | WS & SGE | WS & SGE | WS & SGE | WS & SGE | WS & SGE | WS & SGE | WS & SGE | WS & SGE | WS & SGE | WS & SGE | WS & SGE | WS & SGE | WS & SGE | WS & SGE | WS & SGE | WS & SGE | WS & SGE | WS & SGE | WS & SGE | WS & SGE | WS & SGE | WS & SGE | WS & SGE | WS & SGE | WS & SGE | WS & SGE | WS & SGE | WS & SGE | WS & SGE | WS & SGE | WS & SGE | WS & SGE | WS & SGE | WS & SGE | WS & SGE | WS & SGE | WS & SGE | WS & SGE | WS & SGE | WS & SGE | WS & SGE | WS & SGE | WS & SGE | WS & SGE | WS & SGE | WS & SGE | WS & SGE | WS & SGE | WS & SGE | WS & SGE | WS & SGE | WS & SGE | WS & SGE | WS & SGE | WS & SGE | WS & SGE | WS & SGE | WS & SGE | WS & SGE | WS & SGE | WS & SGE | WS & SGE | WS & SGE | WS & SGE | WS & SGE | WS & SGE | WS & SGE | WS & SGE | WS & SGE | WS & SGE | WS & SGE | WS & SGE | WS & SGE | WS & SGE | WS & SGE | WS & SGE | WS & SGE | WS & SGE | WS & SGE | WS & SGE | WS & SGE | WS & SGE | WS & SGE | WS & SGE | WS & SGE | WS & SGE | WS & SGE | WS & SGE | WS & |

Notes

1. This table shows the key 2014-15 performance indicators for NSW water utilities. More detailed indicators are shown in Tables 6 to 18 and Figures 1 to 68.

2. **No WS** = not responsible for water supply; **No SGE** = not responsible for sewerage;  
**BS** = bulk supplier; **DS** = dual supply; **GW** = groundwater; **UF** = unfiltered; **R** = reticulator.  
For LWUs with No WS or No SGE, results are shown left justified and are not included in the median calculation for water supply and sewerage. NWI indicator numbers are shown in bold below the column number (eg. column (1), NWI indicator **C4**).

3. Where an LWU has not reported an item for 2014-15, the value previously reported has been used where available.  
Such values are shown in this table in *italics bold* .

4. The number of connected properties shown in column (1) for LWUs with "No WS" is the number of sewerage connected properties.

5. **NSW Water Utilities**  
In NSW there are 109 water utilities comprising:
  - 4 metropolitan water utilities (Sydney and Hunter Water Corporations, Water NSW (from 1 January 2015, formerly Sydney Catchment Authority (SCA)) and Hawkesbury Council), and
  - 105 regional Local Water Utilities (LWUs).The 105 LWUs comprise:
  - 100 local government councils (under *Local Government Act 1993*),
  - 5 LWUs (Gosford Council, Wyong Water, Cobar WB, Fish River WS, Essential Energy) under the *Water Management Act 2000* .Of the 105 LWUs,
  - 96 were responsible for water supply (including 3 for bulk supply - Cobar WB, Fish River WS & Rous Water)
  - 99 were responsible for sewerage.
  - 90 were responsible for both water supply and sewerage, 6 for water supply only and 9 for sewerage only.

6. **Totals for Regional NSW**  
The totals shown below are for regional NSW and therefore exclude Sydney and Hunter Water Corporations, Water NSW and Hawkesbury Council. The totals exclude double-counting where bulk water suppliers are involved.
  - Number of water supply connected properties** in regional NSW was 828,000 (col (1)).
  - Total annual urban water supplied** was 291,000 ML (column (2)).
  - Total revenue** for water supply and sewerage was \$1,420M (column (23)).
  - Total current replacement cost (CRC)** of WS and SGE assets was \$28,400M, with a median of \$32,900 per assessment (column (8)).

7. **Statewide medians (regional LWUs):**
  - Residential revenue from water usage charges** - Median is 72% (column (3)), which has increased from 20% to 72% over the past 20 years due to LWU tariff reform and strong pricing signals to encourage efficient water use (figure 12 on page 111).
  - Typical residential bill (TRB)** for water and sewerage - \$1235/assessment for 2014-15 (column (6)).  
The water supply TRB was \$566 (column (4)) and the sewerage TRB was \$669 (column (5)).
  - Typical developer charge** for water and sewerage - \$10,600/ET for 2014-15 (column (7) and Tables 6 and 7).
  - Water quality complaints** - 3 per 1000 properties (column (13)).
  - Average duration of unplanned interruptions** for water supply - 133 minutes (column (14)).
  - Water main breaks** - 9 breaks per 100km of main (column (15)).
  - Total water supply and sewerage complaints** - 19 per 1000 properties (column (16)).
  - Average annual residential water supplied** - 166kL/connected property (col (17)). This has decreased by 50% since 1991 (page 111).
  - Real water loss** - 60 L/connection/d (column (18)).
  - Median sewage volume that was compliant** - 100% (column (19)).
  - Median sewerage main breaks and chokes** - 35 per 100km of main (column (20)).

8. **Statewide medians (financial):**
  - Economic real rate of return (ERRR)** for water supply and sewerage was 1.4% (page 12).  
The water supply ERRR was 1.6% and the sewerage ERRR was 1.7% (columns (27) and (28)).  
100% of LWUs are achieving full cost recovery for water supply and 98% are achieving full cost recovery for sewerage (columns (29) & (30)).  
The remaining 2 sewerage utilities which are not achieving full cost recovery need to do so. Refer also to Tables 6 and 7 and page 29.
  - Net debt/equity** for water and sewerage was -1% (column (24)).

8. **Statewide medians (financial)** continued from left:
  - Operation, maintenance & administration cost (OMA)** for water supply was \$400 and sewerage was \$420 (cols (31) & (32)).  
OMA includes part of the OMA cost of the bulk water supplier but excludes the purchase cost of water. However, NWI indicator F11 includes the purchase cost of water and therefore may differ from column (31). Refer to page 101 of Appendix G.
  - Management cost** for water supply and sewerage - \$301/connected property.  
Water supply management cost was \$141 and sewerage management cost was \$160 per connected property.
  - Capital expenditure** for water supply and sewerage - \$359/property (column (25)).  
The total capital expenditure for water supply and sewerage was \$416M (column (26)).

9. **Category 1 Businesses** - 67 LWUs are Category 1 businesses (ie. with an annual revenue of over \$2M) as defined in the *NSW Government's Policy Statement on Application of National Competition Policy to Local Government, June 1996* .  
66 such LWUs are responsible for water supply and 52 such LWUs are responsible for sewerage.

10. **Pay-for-use water supply tariff** - All of the 93 LWUs providing a reticulated water supply have a pay-for-use water supply tariff (Table 6) (ie. a two-part tariff or an inclining block tariff). Such tariffs comply with IPART recommendations and the *COAG Strategic Framework for Water Reform* .

11. **Physical and chemical water quality** - 98.3% of the 4,600 physical samples and 99.9% of the 4,800 chemical samples tested for NSW LWUs achieved 100% compliance with the *2011 Australian Drinking Water Guidelines (ADWG)* .  
All LWUs complied with chemical quality (health related) and are shown as 'Yes' in column (11) (pages 7, 8, 38, 39 and 101).  
All LWUs complied with physical quality (page 8). The results shown for H4 in column 12 are based on population.

12. **Microbiological water quality** - E.coli contamination is the primary health-related indicator.
  - E.coli** - 99.9% of the 19,400 samples tested for NSW LWUs achieved 100% compliance with the *2011 ADWG*.  
All LWUs complied with these guidelines and are shown as 'Yes' in column (9).  
The public drinking water supply for 99.9% of the urban population in regional NSW complied with both the microbiological and chemical requirements of the *2011 ADWG* (columns (10) and (12)).

13. **Compliance with EPA Discharge Licence for Sewerage**
  - BOD** - 96% of the 4,184 sampling days for NSW LWUs achieved 100% compliance with the 90-percentile limit of their EPA licence for BOD (Biochemical Oxygen Demand). 89% of LWUs complied with the EPA licence for BOD.
  - SS** - 92% of the 4,184 sampling days for NSW LWUs achieved 100% compliance with the 90-percentile limit of their EPA licence for SS (Suspended Solids). 82% of LWUs complied with their EPA licence for SS.  
18 LWUs had no EPA discharge licence limit.

14. **Best-Practice implementation** - overall the LWUs have implemented 90% of the outcomes required by the NSW Best-Practice Management Framework (column (33)).

15. **Strategic Business Plans** (page 4) - 99 LWUs (94%) have completed a sound 30-year water and/or sewerage Strategic Business Plan, which includes a 30-year total asset management plan and a 30-year financial plan (column (34)). These LWUs have demonstrated the long term financial sustainability of their water supply and sewerage businesses to comply with National Competition Policy. These plans cover over 99% of the connected properties in regional NSW. As the plans of 51 of these utilities are now over 4 years old (shown as "Yes\*" in column (34)), these utilities now need to prepare a 30-year IWCM Strategy, financial plan and report in accordance with the July 2014 IWCM Check List (www.water.nsw.gov.au). Similarly, the 17 LWUs whose IWCM Strategy is over 6 years old [shown as Yes<sup>+</sup>] need to prepare such a new IWCM Strategy, financial plan and report [column (34)].

16. **Total Urban Water Supplied** of 291,000 ML(column (2)) comprises 260,000 ML potable water, 20,000 ML non-potable water and 11,600 ML recycled water. Similarly, the average annual residential water supplied (column (3)) includes non-potable & recycled water

17. **Reuse of recycled water** comprised 39,000 ML which is 22% of the volume of sewage collected and was carried out by 70% of utilities, mostly for agriculture (columns (21) and (22)). Refer also to figures 26a and 27 on page 114.

18. **National Water Initiative (NWI) Indicators** - The 32 NSW water utilities with over 10,000 connected properties (3 metropolitan utilities and 29 regional utilities) are required to report their performance under the NWI. The results that have met the rigorous NWI auditing requirements have been published in the *National Performance Report 2014-15*. Refer also to Notes 14 and 15 on page 35.

19. The performance indicators for Sydney and Hunter Water Corporations and Water NSW were obtained from the *National Performance Report 2014-15 for Urban Water Utilities* (www.bom.gov.au).

Notes

1. Table 5C shows each NSW regional local water utility's [LWU] **water supply infrastructure asset condition** [col 56], **asset rehabilitations** [col 50 to 52], **asset renewal expenditure** [col 53 to 55], **financial performance** [col 42 to 49 and 57 to 63], water supply **system performance** [col 64 to 70b], typical residential bill [TRB - col 70], strategic business planning [SBP - col 72, this includes a 30-year total asset management plan [capital works plan identifying each of works for growth, improved standards and renewals, operation plan, including non-build solutions and maintenance plan] and 30-year financial plan] and its level of implementation of the Best-Practice Management [BPM] of Water Supply and Sewerage requirements [BPM - col 71].
- In addition to showing the results for each LWU, Table 5C shows the Statewide median for each indicator, as well as the **2014-15 National Median** for the National Water Initiative [NWI] performance indicators [col 42, 44, 46 and 61 to 70].
2. The sources of data for Table 5C are:
- col 47, 48, 56 to 60 are from each council's reported Special Schedule 7;

- col 42 to 46 and col 61 to 63 from each council's reported Special Schedules 3 and 4; and

- col 64 to 72 are based on the results reported by each council in the NSW Water Supply and Sewerage Performance Monitoring Database.
- Note that minor errors identified in the reported results for column 56 for Boorowa have been corrected.
3. **Totals for water supply in regional NSW:**
- o **Total current replacement cost of system assets** - \$14.3B [col 43],

o **Total written down replacement cost** - \$9.0B [col 44],

o **Total annual depreciation** - \$193M [col 45],

o **Total** estimated cost to Bring to Satisfactory Standard<sup>1</sup> **(BTS) – \$469M** [col 47],

o **Total annual maintenance expenditure** - \$89M [col 48],

o **Total capital expenditure** - \$200M [col 46],

o **Total asset renewal expenditure** - \$85M [col 53],

o **Drinking water management system [DWMS]** - 94 (100%) [col 70a],

o **No. of water treatment operators meeting national certification requirements** – 348 [col 70b],

o **Strategic Business Plan [SBP]** - 90 (94%) [col 72] and **Overall BPM implementation [WS]** – 91% [col 71].
- The total \$469M for BTS is 2.4 times the annual depreciation of \$193M, 3.3% of the current replacement cost of system assets<sup>2</sup> of \$14.3B and 62% of the 2014-15 annual water supply revenue of \$757M.
4. **Statewide medians for water supply in regional NSW:**
- o **Written down current replacement cost per connected property** - \$10,000 [col 42] ; National Median \$7,660

o **Assets in condition 1** - 36% [col 56]

o **Assets in condition 2** - 36% [col 56]

o **Assets in condition 3** - 17% [col 56]

o **Assets in condition 4** - 2% [col 56]

o **Assets in condition 5** - 0% [col 56]

o **Water main rehabilitations** per 100 km of main – 0.5 km [col 50]

o **Service connection rehabilitations** – 0.5% [col 51]

o **Water meter rehabilitations** - 3.5% [col 52]

o **Asset renewals** per 100 km of main – \$244,000 [col 54]

o **Asset renewals** / current replacement cost of assets – 0.4% [col 55]

o **Renewals Ratio** [Asset Renewals/Depreciation] – 0.36 [col 57]

o **Backlog Ratio** [BTS/ Value of Infrastructure] – 0.02 [col 58]

o **Asset Maintenance Ratio** [Actual Maintenance/Required Maintenance] – 1.00 [col 59]

o **Capital Expenditure Ratio** [Capital expenditure/Depreciation] – 0.74 [col 60]

o **Operating Cost** [OMA cost/connected property – **F11**] - \$400 [col 61]; National Median \$455

o **Water Mains Maintenance cost** per 100 km of main - \$172,000 [col 49]

o **Net Debt to Equity** [WS & SGE – **F22**] – -1% [col 62]; National Median 11%

o **Economic Real Rate of Return** [**F17**] – 1.6% [col 63]; National Median 1.9%

o **Water Main breaks**/100km of main [**A8**] – 9 [col 64]; National Median 13

1 BTS - Estimated cost to bring to a satisfactory standard.

2 This value of 3.3% is consistent with the col 58 value of 0.03 (ie. 3%) for the median LWU. The value of the Statewide median for col 58 is 0.02, which indicates a lower BTS proportion for the larger LWUs.

4. **Statewide medians for water supply in regional NSW:** (continued from left)
- o **Unplanned interruptions to supply** per 1000 properties [**C17**] – 24 [col 65]; National Median 91

o **Real Loss** [leakage/connection/d - **A10**] – 60 [col 66]; National Median 76

o **Water quality complaints**/1000 properties [**C9**] – 3 [col 67]; National Median 2

o **Water service complaints**/1000 properties [**C10**] – 6 [col 68]; National Median 0

o **% of Population with microbiological water quality compliance** [**H3**] – 100% [col 69]; National Median 100%

o **Typical Residential Bill**/assessment [2014-15 – **P3**] - \$566 [col 70]; National Median \$589.
- The totals in note 3 above and the statewide medians in this note 4 provide useful information on the infrastructure asset condition, asset rehabilitations, asset renewal expenditure, financial performance, system performance, the typical residential bill and the extent of asset management and strategic business planning for water supply in regional NSW.
- Disclosure of the 32 indicators shown for each LWU in Table 5C provides transparency and public accountability.
5. **LWU Planning:**
- As indicated on page 8 of the *NSW Water and Sewerage Strategic Business Planning Guidelines* (www.water.nsw.gov.au), the provision of water supply and sewerage services is highly capital intensive. Accordingly, sound planning, analysis and community involvement are essential.
- As noted on pages 3 and 22 of the *2014-15 NSW Water Supply and Sewerage Performance Monitoring Report*, each LWU needs to prepare a 30-year Integrated Water Cycle Management (IWCM) Strategy, financial plan and report in accordance with the July 2014 IWCM Check List (www.water.nsw.gov.au). This involves a 30-year total asset management plan (TAMP – refer to note 1 above), which includes a **sound 30-year renewals plan** in accordance with Item 7F of the Strategic Business Planning Check List (www.water.nsw.gov.au). Only 'proven' renewals projects should be included in the first 5 years of a LWU's renewals plan.
6. **Comment on reported Asset Condition [col 56]:**
- Note 4 above shows that the Statewide medians for assets in condition 1, 2, 3, 4 and 5 are 36%, 36%, 17%, 2% and 0% respectively.
- With regard to assets in **condition 5 (very poor)**, **59 LWUs** (62%) had a **0%** result.
- The performance of the following 5 LWUs, which had a result greater than 6% for condition 5 is analysed below using the results in Table 5C:
- o Gundagai 100% - has a **moderate TRB and a high OMA cost**, full cost recovery, has reported no water quality complaints in 2014-15, but reported 8 complaints per 1000 properties in 2013-14. 100% of reticulated population received a water supply which complied with the 2011 Australian Drinking Water Guidelines (ADWG) and has reported 11 water main breaks per 1000 properties in 2013-14, but did not report in 2014-15. Asset renewals expenditure was \$75,000 per 100 km of main, a total of \$27,000 or 0.1% of CRC (the Current Replacement Cost of system assets). Has a strategic business plan over 4 years old and now needs to prepare a 30-year IWCM Strategy and financial plan. Has implemented 90% of the BPM outcomes. Has 2 fully qualified water treatment works operators.

o Central Darling 45% - has a **high TRB and very high OMA cost**, full cost recovery, reported a very high 50 water quality complaints per 1000 properties, 100% of reticulated population received a water supply which complied with ADWG, had a very high level of water main breaks. Has rehabilitated 0.4% of its service connections and 0.5% of its water meters in 2014-15. Does not have a strategic business plan and financial plan and now needs to prepare a 30-year IWCM Strategy and financial plan. Also needs to apply appropriate non-residential water supply charges. Has implemented 80% of the BPM outcomes. Has a fully qualified water treatment works operator and 5 operators undergoing training.

o Cobar 16% - has a **high TRB and a very high OMA cost**, full cost recovery, reported a high level of water quality and service complaints, 100% of reticulated population received a water supply which complied with ADWG, had a high level of water main breaks. Has rehabilitated 0.9 km of mains/100km and 3.6% of its water meters in 2014-15. Has a current strategic business plan and IWCM Strategy. Has implemented 100% of the BPM requirements. Has a fully qualified water treatment works operator and has 1 operator undergoing training.

o Walgett 14% - has a **high TRB and moderate OMA cost**, full cost recovery, reported no water quality complaints in 2014-15, but reported 3 complaints per 1000 properties in 2013-14, 93% of reticulated population received a water supply which complied with ADWG, had a moderate level of water main breaks. Has rehabilitated 0.3% of its water meters in 2014-15. Asset renewals expenditure was \$1,900,000 per 100 km of main, a total of \$1,760,000 or 0.3% of CRC (the Current Replacement Cost of system assets). Does not have a strategic business plan and financial plan and now needs to prepare a 30-year IWCM Strategy and financial plan. Also needs to apply appropriate developer charges. Has implemented 80% of the BPM requirements. Has a fully qualified water treatment works operator and has 4 operators undergoing training.

o Moree Plains 11% - has a **high TRB and OMA cost**, full cost recovery, reported a high level of water service complaints, 100% of reticulated population received a water supply which complied with ADWG, had a very high level of water main breaks. Asset renewals expenditure was \$47,000 per 100 km of main, a total of \$77,000 or 0.1% of CRC. Has rehabilitated 0.6 km per 100 km of mains and 0.9% of its water meters in 2014-15. Has a strategic business plan and an IWCM Evaluation Study. Now needs to prepare an IWCM Strategy and financial plan. Has implemented 100% of the BPM requirements. Has 3 fully qualified water treatment works operators.

Table 5D: Sewerage - Infrastructure Asset Condition and Performance - 2014-15

| WATER UTILITY                                   |                          | SEWERAGE INFRASTRUCTURE INDICATORS (including SPECIAL SCHEDULE 7 - Condition of Public Works - refer to note 2) |                          |                               |  |                     |  |                             |                          |                           |                         |                |                           |          |                                   |    |    |    |    |                               |                               | SYSTEM PERFORMANCE                        |                                    |                     |                    |                              |                       |                      |                   |                             |                                  | BPM              |                          |  |                                   |                              |                                  |  |

Notes

1. Table 5D shows each NSW regional local water utility's [LWU] **sewerage infrastructure asset condition** [col 86], **asset rehabilitations** [col 81, 82], **asset renewal expenditure** [col 83 to 85], **financial performance** [col 73 to 80 and 87 to 93], sewerage **system performance** [col 94 to 99], typical residential bill [TRB - col 100], strategic business planning [SBP - col 102, this includes a 20 to 30-year total asset management plan [capital works plan identifying each of works for growth, improved standards and renewals, operation plan, including non-build solutions and maintenance plan] and 20 to 30-year financial plan] and its level of implementation of the Best-Practice Management [BPM] of Water & Sewerage required outcomes [BPM - col 101]. Table 5D also shows the Statewide median for each indicator, as well as the **2014-15 National Median** for the National Water Initiative [NWI] performance indicators [col 72, 91, 92, 93, 94, 97, 100].
2. The sources of data for Table 5D are: col 78, 79, 86 to 90 are from each council's reported Special Schedule 7; col 73 to 77 and col 91 to 93 from each council's reported Special Schedules 5 and 6; and col 94 to 102 are based on the results reported by each council in the NSW Water Supply and Sewerage Performance Monitoring Database. Note that minor errors identified in the reported results for column 86 for Weddin have been corrected.
3. Totals for sewerage in regional NSW:

o Total current replacement cost of system assets - \$13.8B [col 74],

o Total written down replacement cost - \$9.3B [col 75],

o Total annual depreciation - \$185M [col 76],

o Total estimated cost to Bring to Satisfactory Standard<sup>1</sup> (BTS) – \$393M [col 78],

o Total annual maintenance expenditure - \$90M [col 79],

o Total capital expenditure - \$208M [col 77],

o Total asset renewal expenditure - \$90M [col 83],

o Pollution Incident Response Management Plan (PIRMP)? - 81 (82%) [col 100a]

o Strategic Business Plan [SBP] - 93 (94%) [col 102] and Overall BPM implementation [SGE] – 89% [col 101].
- The total \$393M for BTS is 2.1 times the annual depreciation of \$185M, 2.9% of the current replacement cost of system assets<sup>2</sup> of \$13.8B and 59% of the 2014-15 annual sewerage revenue of \$663M.

Notes (continued)

4. Statewide medians for sewerage in regional NSW:
  - Written down current replacement cost per connected property - \$11,600 [col 73] ; National Median \$9,380
  - Assets in condition 1 - 43% [col 86]
  - Assets in condition 2 - 32% [col 86]
  - Assets in condition 3 - 14% [col 86]
  - Assets in condition 4 - 2% [col 86]
  - Assets in condition 5 - 0% [col 86]
  - Sewer main rehabilitations % of total length – 0.5 km [col 81]
  - Service connection rehabilitations – 0.1% [col 82]
  - Asset renewals per 100 km of main – \$387,000 [col 84]
  - Asset renewals / current replacement cost of assets – 0.5% [col 85]
  - Renewals Ratio [Asset Renewals/Depreciation] – 0.38 [col 87]
  - Backlog Ratio [BTS/ Value of Infrastructure] – 0.02 [col 88]
  - Asset Maintenance Ratio [Actual Maintenance/Required Maintenance] – 0.94 [col 89]
  - Capital Expenditure Ratio [Capital expenditure/Depreciation] – 0.89 [col 90]
  - Operating Cost [OMA cost/connected property – F12] - \$420 [col 91]; National Median \$400
  - Sewer Mains Maintenance cost per 100 km of main - \$134,000 [col 80]
  - Net Debt to Equity [WS & SGE – F22] – -1% [col 92]; National Median 11%
  - Economic Real Rate of Return [F18] – 1.7% [col 93]; National Median 3.0%
  - Sewer Main breaks/100km of main [A4] – 35 [col 94]; National Median 17
  - Infiltration/ML/100km of main – 83 [col 95]
  - Sewer Overflows/100km of main – 10 [col 96]
  - Sewerage service complaints/1000 properties [C11] – 6 [col 94]; National Median 1
  - % sewage treated that was compliant [E4] – 100% [col 98]
  - Sewage odour complaints/1000 properties – 1 [col 99]
  - Typical Residential Bill/assessment [2014-15 – P6] - \$669 [col 100]; National Median \$667.

The totals in note 3 on the previous page and the statewide medians in this note 4 provide useful information on the infrastructure asset condition, asset rehabilitations, asset renewal expenditure, financial performance, system performance, the typical residential bill and the extent of asset management and strategic business planning for sewerage in regional NSW.

Disclosure of the 32 indicators shown for each LWU in Table 5D provides transparency and public accountability.

5. LWU Planning:

As indicated on page 8 of the *NSW Water and Sewerage Strategic Business Planning Guidelines* ([www.water.nsw.gov.au](http://www.water.nsw.gov.au)), the provision of water supply and sewerage services is highly capital intensive. Accordingly, sound planning, analysis and community involvement are essential.

As noted on pages 3 and 22 of the 2014-15 NSW Water Supply and Sewerage Performance Monitoring Report, each LWU needs to prepare a 30-year Integrated Water Cycle Management (IWCCM) Strategy, financial plan and report in accordance with the July 2014 IWCCM Check List ([www.water.nsw.gov.au](http://www.water.nsw.gov.au)).

This involves a 30-year total asset management plan (TAMP – refer to note 1), which includes a **sound 30-year renewals plan** in accordance with Item 7F of the Strategic Business Planning Check List ([www.water.nsw.gov.au](http://www.water.nsw.gov.au)). Only ‘proven’ renewals projects should be included in the first 5 years of a LWU’s renewals plan.

6. Comment on reported Asset Condition [col 86]:

Note 4 above shows that the Statewide medians for assets in condition 1, 2, 3, 4 and 5 are 43%, 32%, 14%, 2% and 0% respectively.

With regard to assets in **condition 5 (very poor)**, **58 LWUs** (59%) had a **0%** result.

The performance of the following 12 utilities, which had a result greater than 6% for condition 5 is analysed below using the results in Table 5D:

  - Bland 100% - has a **low TRB and a low OMA cost**; has full cost recovery, reported a moderate level of sewerage service and odour complaints, 100% of sewage complied with licence and had a high level of sewer main chokes and breaks. Rehabilitated 4.1% of its sewerage mains and 0.2% of its service connections in 2014-15. Has a strategic business plan (SBP) and now needs to prepare a 30-year IWCCM Strategy and financial plan as its existing SBP is over 4 years old. Also needs to apply appropriate non-residential sewerage charges. Has implemented 78% of the BPM outcomes. Has 2 fully qualified sewage treatment works operators.

1 BTS - Estimated cost to bring to a satisfactory standard.

2 This value of 2.9% is consistent with the col 88 value of 0.02 (ie. 2%) for the median LWU. The value of the Statewide median for col 88 is 0.02, which indicates a lower BTS proportion for the larger LWUs.

6. Comment on reported Asset Condition [col 86]: (continued from left)
  - Gundagai 100% - has a **low TRB and a high OMA cost**, has full cost recovery, did not report service or odour complaints, sewage licence compliance, sewer main chokes & breaks, rehabilitation of its sewerage mains & service connections in 2014-15 but had 18 service complaints & 14 sewer main breaks & chokes per 1000 properties in 2013-14. Has a SBP and now needs to prepare a 30-year IWCCM Strategy & financial plan as its existing SBP is over 4 years old. Has implemented 67% of the BPM outcomes. Has 4 fully qualified sewage treatment works operators.
  - Hawkesbury 19% - has a **low TRB and a high OMA cost**; has full cost recovery, reported a moderate level of sewerage service and odour complaints. Its sewage effluent did not comply with its licence and had a moderate level of sewer main chokes and breaks. Asset renewals expenditure was \$161,000 per 100 km of main, a total of \$296,000 or 0.2% of CRC (the Current Replacement Cost of system assets. Has an IWCCM Evaluation and a strategic business plan (SBP) and now needs to prepare a 30-year IWCCM Strategy and financial plan as its existing SBP is over 4 years old. Has implemented 100% of the BPM outcomes. Has 3 fully qualified sewage treatment works operators.
  - Kempsey 12% - has a **moderate TRB and a high OMA cost**; has full cost recovery, reported a low level of sewerage service & odour complaints, 74% of sewage complied with licence and had a moderate level of sewer main chokes and breaks. Asset renewals expenditure was \$456,000 per 100 km of main, a total of \$1,250,000 or 0.6% of CRC (Current Replacement Cost of system assets). Rehabilitated 0.1% of service connections in 2014-15. Has a strategic business plan (SBP) and now needs to prepare a 30-year IWCCM Strategy and financial plan as its existing IWCCM Strategy is over 6 years old. Has implemented 100% of the BPM outcomes. Has 8 fully qualified sewage treatment works operators.
  - Walgett 12% - has a **very low TRB and OMA cost**; has full cost recovery, reported a low level of sewerage service and odour complaints, 67% of sewage complied with licence and had a very high level of sewer main chokes and breaks. Asset renewals expenditure was \$431,000 per 100 km of main, a total of \$207,000 or 1.1% of CRC (the Current Replacement Cost of system assets. Rehabilitated 2.1% of its sewerage mains and 0.0% of its service connections in 2014-15. Does not have a strategic business plan or IWCCM strategy and now needs to prepare a 30-year IWCCM Strategy and financial plan. Also needs to apply appropriate non-residential sewerage charges, trade waste fees and charges and developer charges. Has implemented 56% of the BPM outcomes. Has one sewage treatment works operator undergoing training.
  - Bourke 9% - has a **low TRB and moderate OMA cost**; has full cost recovery, reported a very high level of sewerage service complaints, 100% of sewage complied with licence and had a high level of sewer main chokes and breaks. Rehabilitated 0.0% of its sewerage mains and 0.8% of its service connections in 2014-15. Has a strategic business plan and IWCCM Strategy. Also needs to apply appropriate non-residential sewerage charges. Has implemented 89% of the BPM outcomes. Has 5 sewage treatment works operators in training.
  - Deniliquin 9% - has a **moderate TRB and OMA cost**; has full cost recovery, reported a moderate level of sewerage service and odour complaints, 100% of sewage complied with licence and had a moderate level of sewer main chokes and breaks. Asset renewals expenditure was \$361,000 per 100 km of main, a total of \$386,000 or 0.7% of CRC (the Current Replacement Cost of system assets. Has a strategic business plan and IWCCM Strategy. Has implemented 100% of the BPM outcomes. Has 2 fully qualified sewage treatment works operators.
  - Lithgow 9% - has a **moderate TRB and high OMA cost**; has full cost recovery, has reported a high level of sewerage service complaints. 81% of sewage complied with licence & had a very high level of sewer main chokes & breaks. Asset renewals expenditure was \$161,000 / 100km main, a total of \$1,200,000 or 0.2% of CRC (Current Replacement Cost of system assets). Rehabilitated 1.8% of sewerage mains in 2014-15. Has a strategic business plan (SBP) & now needs to prepare 30-year IWCCM Strategy & financial plan as its existing SBP is over 4 years old. Also needs to apply appropriate developer charges. Has implemented 89% of the BPM outcomes. Has 6 fully qualified sewage treatment works operators.
  - Lockhart 9% - has a **low TRB and OMA cost**; has full cost recovery, reported a moderate level of sewerage service and odour complaints, 69% of sewage complied with licence and reported no sewer main chokes and breaks. Rehabilitated 0.0% of its sewerage mains and 0.1% of its service connections in 2014-15. Has a current strategic business plan and IWCCM Evaluation. Also needs to apply appropriate developer charges. Has implemented 89% of the BPM outcomes. Has 3 fully qualified sewage treatment works operators.
  - Bellingen 8% - has a **high TRB and a high OMA cost**; has full cost recovery, reported a moderate level of sewerage service & odour complaints, 100% of sewage complied with licence and had a low level of sewer main chokes and breaks. Asset renewals expenditure was \$221,000 per 100 km of main, a total of \$221,000 or 0.4% of CRC (the Current Replacement Cost of system assets. Rehabilitated 0.6% of service connections in 2014-15. Has a strategic business and IWCCM Strategy. Has implemented 100% of the BPM outcomes. Has 4 fully qualified sewage treatment works operators and one operator undergoing training.
  - Muswellbrook 8% - has a **low TRB and OMA cost**; has full cost recovery, reported a low level of sewerage service and odour complaints, 47% of sewage complied with licence and had a low level of sewer main chokes and breaks. Asset renewals expenditure was \$246,000 per 100 km of main, a total of \$433,000 or 0.5% of CRC (Current Replacement Cost of system assets). Rehabilitated 0.6% of its sewerage mains and 0.1% of its service connections in 2014-15. Has a strategic business plan and now needs to prepare a 30-year IWCCM Strategy & financial plan as its existing IWCCM Strategy is over 6 years old. Has implemented 100% of the BPM outcomes. Has 3 fully qualified sewage treatment works operators.
  - Moree Plains 7% - has a **low TRB and a moderate OMA cost**; has full cost recovery, reported a very high level of sewerage service complaints, 100% of sewage complied with licence and had a high level of sewer main chokes and breaks. Asset renewals expenditure was \$2,220,000 per 100 km main, a total of \$1,980,000 or 3.5% of CRC (the Current Replacement Cost of system assets). Rehabilitated 0.5% of service connections in 2014-15. Has a strategic business plan (SBP) & now needs to prepare 30-year IWCCM Strategy & financial plan as its existing SBP is over 4 years old. Has implemented 100% of the BPM outcomes. Has 4 fully qualified sewage treatment works operators.

Table 6: Water supply - residential charges, bills & cost recovery

| WATER UTILITY                 |                                   |                 |                 | RESIDENTIAL CHARGES |                           |             |              |                |                                      |              |              |                |                      |             |           |         |                                    |       | COST RECOVERY        |       |       |                          |        |        |  |        |        |                  |       |       |                     |       |       | Total Connected Properties |  |           |       |   |       |       |            |        |                     |  |

NOTES: 1. **Residential Revenue from Usage Charges:** Where this is marked \*, it has been calculated from the projected typical residential bill for the 2015/16 financial year as this provides a higher value than the result for the 2014/15 financial year. 30 LWUs with 4,000 or more properties (64%) obtained at least 70% of residential revenue from water usage charges (column 13). This includes Wyong and Essential Energy, who have been granted a deemed compliance as their prices are regulated by IPART. 38 LWUs (87%) with fewer than 4,000 properties obtained at least 45% of their residential revenue from usage charges.

2. **The charges, bills and costs** shown for each financial year are those applicable at that time and involve no CPI adjustment. Column (5e) shows that 47% of LWUs now have residential water billing in accordance with the National Guidelines for Residential Customers' Water Accounts. A further 18% of LWUs have made significant progress towards such billing.

3. **Dual Water Supplies:** 12 LWUs had a dual water supply to over 50% of their residential customers with a potable supply for indoor use and a non-potable supply for outdoor use (refer to General Notes - Note 8 on page 33).

4. **Average Annual Residential Water Supplied (Dual Supplies):** The 12 Dual Supply LWUs are shown on two rows. The first row is labelled Dual Supply while the second row is labelled Non-Potable. The first row in column (14a) shows the **potable** average Annual Residential Water Supplied while the second row in column (14b) shows the **non-potable** Average Annual Residential Water Supplied (see also Note 8 on page 33). The total potable plus non-potable Average Annual Residential Water Supplied is shown in the first row in column (14b) and column (14c).

5. **Median Annual Residential Water Supplied:** The median Average Annual Residential Water Supplied (potable plus non-potable) has fallen by 50% over the last 24 years to 166 kL/property (184 L/person/d).

6. **Full Cost Recovery** has been achieved by all 96 LWUs. These comprise 76 utilities which had either an Economic Real Rate of Return or Return on Assets of  $\geq 0$  for the 2014/15 financial year (shown as "

NOTES: 1. 79 LWUs have non-residential sewerage charges which substantially meet the requirements of the Best-Practice Management Guidelines (Appendix C, page 84) and 80 LWUs have appropriate trade waste fees and charges.

2. The charges, bills and costs shown for each financial year are those applicable at that time and involve no CPI adjustment.

3. Full Cost Recovery for sewerage has been achieved by 97 utilities. These comprised 87 utilities which had either an Economic Real Rate of Return or Return on Assets of >=0 for the 2014/15 financial year, shown as "Y" in col (11a). In addition they include 10 utilities which have significantly increased their 2015/16 charges in order to recover all their costs which are shown as "Y\*". A total of 2 LWUs did not achieve full cost recovery. These are shown as "N".

4. Byron also has a residential sewer usage charge of 177c/kL. Lithgow removed its sewer usage charge in 2013/14.

Notes:

- 1. Yes\* in column 1 indicates that the LWU has adopted a trade waste policy before 2009, which needs significant updating.
- 2. 85% of LWUs have an appropriate trade waste policy and 81% of LWUs have appropriate trade waste fees and charges.
- 3. The non-residential sewer usage charges and trade waste usage charges over the last 6 years are shown on Figures 44 and 45 respectively (page 81 and 82).

Table 8: 2014-15 NSW urban water supplied

Notes:

- Source:** Data provided by the 105 regional NSW water utilities for the *2014-15 NSW Water Supply and Sewerage Benchmarking Report*. 96 of these utilities are responsible for water supply. Columns (11) and (11a) report the volume of recycled water use and include a further 9 utilities which are responsible for sewerage only.
- The volumes of water supplied by Sydney and Hunter Water Corporations and Water NSW (from January 2015, formerly Sydney Catchment Authority) were obtained from the *National Performance Report 2014-15* and have not been included in the totals shown above.
- The total water supplied for all regional water utilities shown in the bottom line of the above table excludes double counting where water is supplied by a bulk supplier. Similarly, the total water sourced shown in the bottom line of the table excludes double counting between bulk suppliers and reticulators.
- Incomplete Data:** Where a water utility has not reported its residential use (col (1)), the residential use has been calculated based on the average percentage of 58% of the Total Potable Urban Water Supplied shown in Note 8. Where a water utility has not reported its total potable Urban Water Supplied (col (10)), the previous years' reported value has been used. These values are shown in *italics bold* (see also Note 6).
- Where a LWU has only reported data for 'residential' use but not for 'commercial' or for 'industrial' use, the reported 'residential' value has been reduced and a 'commercial/industrial' component has been included. In this case, the 'residential' component has been calculated based on the average percentage of 58% of the Total Urban Water Supplied shown in Note 8 below, and is shown in italics bold.
- Non-Revenue Water:** Non-Revenue Water includes Unbilled Water (Unbilled Authorised Supply - fire fighting and mains flushing - refer also to Notes 9 and 10 on pages 33 and 34), Real Losses (mostly Leakage) and Apparent Losses (under registration of customer meters and illegal use).  
Leakage studies for over 40 NSW LWUs together with Statewide analysis of Non-Revenue Water for NSW water utilities, indicate Leakage is a minimum of 6% of potable Urban Water Supplied (range 6% to 35%) while Non-Revenue Water is a minimum of 10% (comprising Leakage [minimum 6%] and Apparent Loss plus Unbilled Water [minimum 4%]). Recent analysis of reported data for utilities with over 10,000 connected properties tends to corroborate these minimum values. Therefore, for those utilities reporting Non-Revenue Water of less than 10% (col (9)), the Non-Revenue Water has been increased to 10% of the Urban Water Supplied (col (10)) (shown in *italics bold*), unless the LWU has provided evidence of a lower value of Leakage under Note 7 below.  
In such a case, the adopted value for Non-Revenue Water is the reported Leakage plus 4%.
- Real Losses (mostly Leakage):** Leakage is a component of Non-Revenue Water. As described in Note 6 above, a minimum of 6% of the Total Urban Water Supplied (potable) has been adopted for Leakage, unless evidence of a lower value has been provided by the LWU. Therefore, unless corroborated by evidence, (eg. a reservoir drop test, detailed waste metering or night flow analysis (see Table 10 on page 172)), reported Leakage of less than 6% (column (8)) has been increased to 6% (shown in *italics bold*).
- Potable Water Supplied:** The above analysis shows that the total 2014-15 urban water supplied for regional NSW was 291,000 ML (column (13)), of which 260,000 ML (i.e. 89%) (column (10)) was potable water. The average uses as a percentage of the total **potable** water supplied were:
  - ♦ Residential - 58% (column (1))
  - ♦ Commercial - 15% (column (2))
  - ♦ Industrial - 6% (column (3))
  - ♦ Non-Revenue Water (NRW) - 13% (column (9))In addition, the rural, institutional and public parks and gardens uses were 3%, 3% and 2% of the total potable water supplied respectively (columns (4), (5) and (6)). The components of industrial and rural water supplied are shown in Table 8D on page 166.
- Non-Potable Water Supplied:** The total non-potable urban water supplied was 20,000 ML (column (12c)) which included 11,600 ML recycled urban water supply (column (11)+(11a)). These volumes are 7% and 4% respectively of the 291,000 ML **total urban water** supplied (column (13)). The non-potable urban supply was mainly for outdoor uses in dual water supplies, but also includes supplies to industry and other outdoor uses.
- The **total urban water supplied** (column (13)) comprises the sum of the potable water supplied (column (10)) and non-potable water supplied (column (12c)) which includes recycled urban water (columns (11) & (11a)).
- Recycled water** used for non-potable urban water supply is shown in columns (11) & (11a). Recycled water used for non-potable non-urban water supply (agriculture, environmental and on-site use) is shown in column (11b). The total volume of recycled water for NSW regional water utilities is shown in column (11c). For the utilities that did not report this year but reported >10% recycled water in the previous year, the percentage recycled is assumed to be the same as that of the previous year (refer also to section H4.7 on page 357). This results in a volume of recycled water of 39,000 ML (see also Table 15 on page 192) which is 22% of the total volume of sewage collected. Refer also to Figure 55 on page 92, figures 27 and 26a of Table 4 on page 111 and graph 13 on page 208.
- All LWUs reported nil for Volume Sourced from Desalination (W3), Bulk Recycled Water Purchased (W6), Water Supplied for Environmental Flows (W13) and Bulk Recycled Water Exports (W15).

Notes:

1. Revenue water supplied (potable) = Billed, Authorised water supplied (metered and unmetered).
2. Non-Revenue water supplied (potable) = Real Losses + Apparent Losses + Unbilled Water  
Real Loss is Leakage; Apparent Loss is under registration of customer meters and illegal use; Unbilled Water is authorised unbilled consumption for firefighting and mains flushing.
3. Real Losses (Leakage) in column (2) above are the same as those shown in column (8) of Table 8. They relate only to Total Urban Water Supplied (potable) and exclude bulk water exports.
4. Total Urban Water Supplied (Revenue Water (potable) plus Non-Revenue Water Supplied (potable)) in column (19) above is the same as that shown in column (10) of Table 8.
5. Minimum Losses: The minimum adopted in this report for Real Loss (Leakage) is 6% of the Total Urban Water Supplied (potable) and the minimum adopted for (Apparent Loss plus Unbilled Water) is 4%, unless the utility has provided evidence for the adoption of a lower Leakage (eg. a reservoir drop test, detailed waste metering or night flow analysis (see Table 10)).  
This results in a minimum Non-Revenue Water of 10% of Urban Water Supplied (potable). Therefore, for those utilities reporting Non-Revenue Water of less than 10% (col (14)), the Non-Revenue Water has been increased to 10% of the Urban Water Supplied (col 15) (shown in italics bold), unless the LWU has provided evidence of a lower value of Leakage under Note 6 below.  
In such a case, the adopted value for Non-Revenue Water is the reported Leakage plus 4%.
6. Real Losses (Leakage): As described in Note 5 above, a minimum of 6% of the Total Urban Water Supplied (potable) has been adopted for Leakage.  
Therefore, unless corroborated by evidence (eg. a reservoir drop test, detailed waste metering or night flow analysis (see Table 10)), reported Leakage of less than 6% (column (8)) has been increased to 6% (shown in italics bold).
7. Water Loss Management Programs: As shown in Table 10 on page 172, 74 of the 93 reticulating local water utilities have recently carried out a water loss management program.

Table 8B: 2014-15 water supplied from source catchments in regional NSW

**Note:**  
For water utilities which did not report their residential volume of water supplied together with commercial and/or industrial volume of water supplied, the percentages tabulated in *Table 8* were applied to their total potable urban water supplied (column 10) and the volume of water supplied for each category summed for each catchment to obtain the above values.

Table 8C: 2014-15 water conservation initiatives

+ There are 12 LWUs with a dual water supply in 2014-15; Balranald, Berrigan, Bourke, Brewarrina, Central Darling, Hay, Jerilderie, Murray, Wakool, Walgett, Warren, Wentworth.  
For these 12 LWUs, note 8 on page 33 reports the approximate total potable annual residential water supplied per property, which is shown in column 56a above. This is lower than the value reported in Column 56 as it is calculated only for those towns with a dual supply.

Notes:

1. Table 10A shows the results for leakage testing for 68 LWUs under the Regional NSW Water Loss Management Program (WLMP) in columns 10 (before leakage detection and repair) and 13 (after leakage detection and repair). Table 10A shows that following leakage detection and repair, the average leakage for these utilities has decreased from 16% to 10% of the potable water supplied (from 164 L/d to 92 L/d per connection). Column 41c above shows the type and extent of leakage testing (Note 6 below) by each utility. This column shows that the leakage testing covered 90% of the service connections for Coffs Harbour (77% of the connections were covered by zoning and flow metering (Z77) and 13% were covered by leakage detection and repair (L13)). Similarly for Mid-Western Regional, 59% of the connections were covered by leakage detection and repair (L59). Column 41d shows the latest reported year of leakage testing for the utility and has been updated from column 18 of Table 10A. In addition, where a utility has not previously reported its result for column 41e, the result in column 13 of Table 10A has been included, subject to DPI Water's acceptance test in the next paragraph.  
However, the zones covered for many other utilities was a small percentage, eg. only 9% of the service connections for Byron (Z9) and 5% for Wyong (Z5). Leakage results of under 6% for a utility have only been accepted as a valid indicator of the utility's performance by DPI Water if the leakage testing covered at least 30% of the utility's service connections. The accepted results are shown in column 41e above and indicate the following 13 utilities have valid leakage test results of under 6% (Bathurst, Boorowa, Brewarrina, Coffs Harbour, Corowa, Griffith, Gunnedah, Moree Plains, Murray, Uralla, Warren, Wyong and Young).
2. The reported Real Losses shown above for NWI indicator A10 (column 41 above) have been rounded in recognition of the significant inherent errors in the determination of distribution system leakage.
3. To compare leakage with other LWUs, LWUs with >20 connections/km should use Real Losses (L/connection/day) (column 41 above), while LWUs with <20 connections/km should use Real Losses (L/km water main/day) (column 41a above).
4. **Leakage** relates only to Total Urban Water Supplied (potable) and excludes bulk water exports and non-potable water supplied. **Non Revenue Water** (NRW) comprises **Real Losses** (mostly leakage), **Apparent Losses** (under-registration of customer meters and illegal use) and **Unbilled Water** supplied (eg. mains flushing).  
As indicated on page 33, Non-Revenue Water (L/connection/d) should be used for tracking system performance over time. Use of Unaccounted for water (UFW) is not appropriate (see page 33) and should no longer be used by LWUs.
5. 74 LWUs have reported carrying out recent leakage testing and/or leakage detection and repair (columns 41c, 41d, 41e above).
6. Reservoir Drop Test (**RDT#**), Waste Metering (**WM#**), Night Flow Metering (**NF#**), Zoning and Flow Metering (**Z#**), Leakage Detection and Repair (**L#**), Pressure Reduction (**P**), where # is the percentage of service connections covered.  
Eg. L95 for Gwydir (column 41c above) indicates that the leakage detection and repair project carried out covered 95% of the utility's service connections.

Table 10A: Estimated Real Water Losses from Regional NSW Water Loss Management Program

Table 10A: Estimated Real Water Losses from Regional NSW Water Loss Management Program

Notes

- 1. The estimated real water losses in Table 10A are from the Water Loss Management Program (WLMP) for Regional NSW Water Utilities – Final Progress and Evaluation Report 2006-2011, Australian Government, NSW Water Directorate and Local Government and Shires Associations of NSW.
- 2. Columns 1, 2, 4, 6, 8 and 18 of Table 10A have been obtained from Appendices 3 and 4 of the above WLMP Report. Columns 11, 14 and 15 have been obtained from Appendix 4 of the Report. Column 17 has been obtained from Appendix 1 of the Report. Columns 3 and 7 have been obtained from Table 9 (Column 18a) and Table 8 (Column 10) of the *2009-10 NSW Water Supply and Sewerage Benchmarking Report* ([www.water.nsw.gov.au](http://www.water.nsw.gov.au)). Columns 5, 9, 10, 12 and 13 have been calculated as indicated in Note 6 below. Columns 15 and 16 show the type, the extent of leakage testing (Note 8 below) carried out by each utility and the year of testing and have been determined from Appendices 1, 3 and 4 of the WLMR Report and Column 5.

Eg. for Clarence Valley, Column 15 indicates leakage detection and repair (L) was carried out for 3 zones covering 61% of the utility's service connections (calculated from columns 3 and 4 -  $[(1629 + 3613 + 7878) / 21430 = 61\%]$  and is shown as L61) and that zoning and district metering was carried out for a zone covering 5% of the connections (shown as Z5) – Column 15 thus shows L61, Z5 for Clarence Valley, resulting in a coverage of 67% (column 3). Similarly, for Coffs Harbour, the testing carried out is shown in column 15 as Z77 and L13, and the overall estimated water loss is shown as 5% in column 13. This is calculated as the values in column 9 for the first 8 Zones plus the value in column 12 for Zone 9, divided by the product of the totals in columns 7 and 5, ie.  $(12.9 + 30.3 + 143.2 + 75.9 + 8.1 + 1.0 + 5.9 + 16.7 + 17.9) / (6273 \times 0.91) = 5.4\%$ .

- 3. Column 15 shows that leakage testing has been carried out for a total of 68 utilities. The estimated total annual water loss (ML) from the 110 zones where water loss management was undertaken (ie. leakage detection and repair and/or pressure reduction), eg. the Kentucky St zone for Armidale, is shown in Column 12. The estimated water losses **after** leakage detection and repair, as a percentage of the annual potable water supplied are shown in Column 13. The estimated water losses **before** leakage detection and repair are shown in columns 8 to 10. Note that columns 8 to 10 show the estimated water losses for 75 zones for a total of 27 water utilities, for which leakage detection and repair was not undertaken, mostly because it was not warranted as the magnitude of the identified water losses was small, eg. 8 such zones are reported above for Coffs Harbour, each with losses of 1% to 12% (column 10). However, also included are some zones with high leakage levels where a leakage reduction project was not undertaken, eg. Bega - Pambula South and Pambula Beach due to high project costs and Brewarrina due to lack of resources.

Taking the Kentucky Street zone in Armidale as an example, the table shows that the leakage was 136 L/c/d, 19.9ML and 15% of the potable water supplied (columns 8 to 10 above) before undertaking water loss management and that the leakage was reduced to 65L/c/d, 9.5ML and 7% of the potable meter supplied (columns 11 to 13) after completion of leakage detection and repair. Similarly, the final row of this table shows that overall leakage for the zones examined for the 68 utilities was 154L/c/d, 13,400ML and 16% of the potable water supplied (columns 8 to 10) before undertaking water loss management and that the leakage was reduced to 92L/c/d, 8,000ML and 10% of the potable water supplied (columns 11 to 13) after completion of leakage detection and repair and/or pressure reduction. The total water saving was 5,500ML (with rounding, column 14).

- 4. Harden (3 Zones) and Tumbarumba (2 Zones) obtained a Minimum Night Flow (MNF) of zero. The water loss for these zones has therefore been shown as "0" in columns 8 to 10 above.
- 5. Results shown in columns 4, 8, 11 and 14 to 18 for Kempsey are from page 94 of Appendix 1 of the WLMR. Volumes for the other columns have been calculated by DPI Water in accordance with Note 6 below.
- 6. Calculations for columns:  $(10) = [(9) \times 100] / (7)$ .  $(13) = [(11) \times 100] / (7)$ .  $(9) = (8) \times (3) \times 365 / 10^6$ .  $(12) = (11) \times (3) \times 365 / 10^6$ .  $(5) = [(4) \times 100] / (3)$ .
- 7. Minor discrepancies in the number of service connections between columns 3 and 4 have been corrected in column 5 for Deniliquin, Kempsey, Murray and Uralla.
- 8. The following acronyms are used in the tables: Reservoir Drop Test (RDT#), Waste Metering (WM#), Night Flow Metering (NF#), Zoning and Flow Metering (Z#), Leakage Detection and Repair (L#), Pressure Reduction (P), where # is the percentage of service connections covered.  
Eg. L95 for Gwydir indicates that the leakage detection and repair project carried out covered 95% of the utility's service connections.
- 9. It is noted that only 9 LWUs in Table 10A have reported leakage of over 12%. 3 of these utilities, which have not carried out leakage detection and repair reported the following leakage results: Brewarrina (34% - project not undertaken); MidCoast Water (16% - pressure management only undertaken at Hawks Nest); and Queanbeyan (27% - project not undertaken). 6 utilities had leakage of over 12% following completion of their water loss management projects: Bogan - Leakage reduced from 38% to 24% of potable water supplied (99% of connections covered); Clarence Valley - Leakage reduced from 27% to 15% of potable water supplied (67% of connections covered); Cootamundra - Leakage reduced from 21% to 13% of potable water supplied (93% of connections covered); Kempsey - Leakage reduced from 17% to 16% of potable water supplied (100% of connections covered); Port Macquarie-Hastings - Leakage reduced from 20% to 14% of potable water supplied (6% of connections covered); and Shoalhaven - Leakage reduced from 34% to 24% of potable water supplied (16% of connections covered).
- 10. 30% coverage is considered to be the minimum coverage needed to adequately characterise a utility's leakage performance. Caution is therefore warranted in interpreting the results reported above for the following 17 utilities which have tested zones covering under 30% of their service connections: Armidale (5% of service connections); Ballina (7%); Bathurst (5%); Byron (17%); Essential Water (18%); Gosford (1%); MidCoast Water (7%); Muswellbrook (12%); Narrabri (18%); Parkes (26%); Port Macquarie-Hastings (6%); Riverina Water (7%); Shoalhaven (18%); Tamworth (12%); Tweed (20%); Wingecarribee (22%); and Wyong (5%). The reported leakage results accepted as a valid indicator of the utility's performance by DPI Water are shown in column 41e of Table 10. Refer also to Note 1 of Table 10 on page 172.

\* Where the residential revenue is reported to be greater than 90% of the revenue from rates and charges, a maximum value of 90% has been adopted. This is shown in *italics bold* in column (58).

\*\* The Operating Cost and Total Cost shown in the table exclude the purchase cost of water but include part of the operating cost of the bulk water provider, apportioned according to the ratio of water purchased to total water supplied to all customers. This differs from the NWI definition, as indicated in section H4.5 on page 355.

+ If the reported management cost is less than \$20/property or not reported, the previous year's management cost has been adopted in column (68) and is shown in *italics bold* . In such cases, the OMA cost per property has not been increased to include this adopted management cost.

Table 12: Water supply - health and levels of service

NOTES:

1. Where chemical water quality is compliant (column 70 - health related) the 95th percentile of results does not exceed the guideline value for each chemical. Refer also to pages 355 and 356 and to Note 7 on page 287.
2. Where the compliance for microbiological water quality (column 71 - health related) is equal to or greater than 98%, the LWU is compliant. Refer also to pages 355 and 356 and to Note 7 on page 287.
3. Physical water quality (column 69 - aesthetic) is compliant if the mean of results is within the Guideline values. Refer also to pages 355 and 356 and to Note 7 on page 287.
4. In each of 2012-13, 2013-14 and 2014-15, the public drinking water supply for 99.9% of the urban population in regional NSW complied with the 2011 ADWG for both microbiological and chemical water quality (cols 70, 70a, 71 and 71a).

- NOTES:
- 1. Operating cost is the OMA cost (operation, maintenance & administration (Col 91b)) which comprises the O & M Cost (operation & maintenance cost (Cols 79 to 82 or Cols 83 to 88)) PLUS Management Costs (Col 91a) which is made up of the Administration cost (Col 89) plus Engineering and Supervision cost (Col 90).
  - 2. O & M cost includes a proportion of the OMA cost of the bulk supplier if appropriate or the purchase cost of water if no bulk supplier (Col 82a).
